Development of water and related land policies in river basins of the arid U.S. west are documented here, from the land boom and growing emphasis on irrigation works between 1870-1880, to the present, showing the influence of changing social values. Public values and policies relating to the Colorado River Basin's natural resources can be divided into two periods, the progressive thrust and the period of conservation/preservation thrust. The former, based on the value of individualism embodied in the Carey (1894), Homestead (1862), and townsite (1906) acts, was characterized by anti-monopoly activities and manifestations of egalitarianism. The conservation/preservation thrust, emboidied by forces led by Pinchot since the turn of the century, is based on the development and wise usage of these resources. These policies, reflecting the development movement in America, have been based on the sustained yield concept. This author applies these values and related policy thrusts to the Colorado River Basin specifically, showing how the progressive thrust, for instance, has been manifest in the excess land laws based on the family concept of low-cost power. Conservation interests have been evident by r and d of sustained yield techniques of water and land resources by the Bureau of Land Management, land grant college programs, the USDA. Historic fluctuations of control and alliance between these two approaches is documented to the present, with this author concluding that it is the strength of political coalition that will determine the effectiveness of present and future policy. L. E. Royer, and J. D. Hunt.
In: Values and Choices in the Development of the Colorado River Basin, ed. by D. F. Peterson and A. B. Crawford, p 173-193. University of Arizona Press, Tucson, 1978. 4 fig, 23 ref.

Descriptors: *Recreation, *Colorado River Basin, *River basin development, *Impoundments, *Recreation demand, Recreation facilities, Project planning, Decision making, Water management(Applied), Multiple-purpose.

Because of the lack of heterogeneity in the Colorado River Basin, these authors have rejected the theory that the Basin as a whole can be considered prototypic of the recreational opportunities in arid lands generally. What requires our attention, they believe, is the role of water, not in the sense of rainfall or climate conditions but the institutional organization of the region, its geopolitical arrangements, and the cultural perceptions of the Colorado River itself. They point out that the management of the flow of water in the river has diminished recreational choices and will narrow further choices in future. If recreation in the drainage basin is to be developed as one of the outputs of multiple-purpose water development, the recreation opportunity spectrum is fixed by the technological capability of large-scale water impoundment, which in turn is dependent on the magnification of benefits. Several examples are given, however, which indicate an erosion of recreational opportunities and resources in the basin based on political decisions of water choice rather than recreational choice that limit and structure recreational futures of the basin. Perceptions based on such water-dependent economic development as the Salt River Project's Navajo Power Plant on the shore of Lake Powell, the use of strip-mined coal from the Black Mesa Mine, and the intrusion of transmission lines into the Paria Canyon Primitive Area, support the contention that this wider continuum of water management strategies has not enhanced the recreation future of the central portion of the Colorado River Basin. COMMUNITY DEVELOPMENT, (COLORADO RIVER BASIN),
California Univ., Santa Barbara.
D. E. Mann
In: Values and Choices in the Development of the Colorado River Basin, ed. by D. F. Peterson and A. B. Crawford, p 195-219. University of Arizona Press, Tucson, 1978. 2 tab, 25 ref.

Descriptors: *Community development, *Colorado River Basin, *Southwest U.S., *Urban sociology, Decision making, Rural sociology, Social aspects, Project planning, Economic justification, River basin development, Regional analysis, Regional economics.

Development of urban and rural communities in the Southwest U.S. as described here is based on available general information as well as on data supplied to the author directly by the cities themselves. The diverse nature of such a large area makes a simple analysis difficult and complex, and this study accordingly opts for a discussion of the Southwest US rather than being obliged to observe the hydrological boundaries of the Colorado River Basin. The primary role of the public decision process in determining the environmental character of each sub-region is emphasized in an analysis of population trends in urban and rural areas of Arizona, New Mexico, Colorado, Utah, and California. Community development plans as discussed here are not derived through market forces but rather through individual perception and choice, which may explain in part the significant lack of focus on the role of a diminishing water supply on many community development projects in the arid southwest: people do not 'choose' to acknowledge the area's water realities. Development plans and processes in Albuquerque, New Mexico, Tucson, Arizona, and Farmington, New Mexico, and Pioche, Nevada are presented in an effort to illustrate the manner in which development choices are perceived and carried out. (See also W79-02732). (Tickes-Arizona).
W79-02740

CARRYING CAPACITY AND PLANNING, (COLORADO RIVER BASIN),
Utah State Univ., Logan.
A. B. Crawford, and A. B. Bishop.
In: Values and Choices in the Development of the Colorado River Basin, ed. by D. F. Peterson and A. B. Crawford, p. 292-313. University of Arizona Press, Tucson, 1978. 8 figs, 2 tabs, 2 refs.

Descriptors: *Carrying capacity, *Colorado River Basin, *Regional analysis, *Planning, *Human resources.

For its size, the Colorado River is probably the most utilized, controlled, and fought over river in the world, as these authors point out in an analysis of how the carrying capacity of the Basin's resources may be a key factor in choices about the region's future growth and development. On the basis of their analysis of the carrying capacity concept, they set forth the parameters of carrying-capacity based planning: identification of driving forces and examinations of the effects of such forces on carrying capacity as well as formulations and implementation of strategies for managing change. They then take up carrying capacity-based planning issues as they relate specifically to the Colorado River Basin: agriculture, environmental quality, and water supply. Their overall posture in defining carrying capacity concepts is a broad one that includes the interactions that occur between human and natural systems, rather than the narrow one that relates to particular aspects such as maximum sustained yield, for instance. In summary, they maintain that the development of carrying capacity concepts can help extend the usefulness of these indicators into the realm of making comparative evaluations of environmental quality dimensions in terms of ranges and limits of acceptable levels, and the impact of various regional growth policies. Descriptors: *Social aspects, *Political aspects, Delaware, Ohio, *Institutions, Michigan, *Attitudes, *Community development, Water supply, Water pollution, *Social values, Environment, Flood control, *Local governments.

The purpose is to analyze the extent and direction of mobilization of local communities for the solution to water-related problems. Community is defined as a public institution established for actualizing life-style values for the interest groups dominant in the locality. Environmental factors become issues or non-issues as they enter into the local goal setting process. It is hypothesized that water supply is more likely to be perceived as a salient problem in growth oriented communities because it is a precondition for industrial growth and population expansion. Water pollution and flooding are more likely to be perceived as salient problems where residential interests are well organized. Data for this study are from interviews with 160 community leaders (89.3% of the population) in 12 small communities; six in Delaware, four in Ohio and two in Michigan. Findings indicate that political mobilization and growth orientation are higher in verticaly integrated communities. Also, community leaders respond to the surfacing of pollution problems with increasing inactivity and local solvability, and supply problems with decreasing inactivity and increasing local solvability. This indicates that where community leaders implement nondecision making for pollution problems, they implement solutions to supply problems. In both cases they attempt to avoid ties with extralocal agencies.

SOCIAL IMPACTS FROM WILDLIFE WITHIN THE COLUMBIA BASIN IRRIGATION DISTRICT,
Washington State Univ., Pullman. Dept. of Forest and Range Management.
J. A. Rajala.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 339, Price codes: A06 in paper copy, A01 in microfiche. MS Thesis, 1979, 107 p, 4 fig, 29 tab, 57 ref, 2 append. OWRT C-7165(No 6213)(2), 14-31-0001-6213.

Descriptors: *Social impacts, Irrigation projects, Planning, Economic impacts, Fish, *Wildlife, *Recreation, *Washington, Management, *Columbia River Basin, *Irrigation districts, *Attitudes, *Social values.

Social impacts to landowners and recreationists from wildlife in the Columbia Basin Irrigation Project were identified through interviews and a questionnaire. Demographic characteristics and other background information of landowners and recreationiests were statistically compared with their evaluation of the social impacts. Both landowner's and recreationists' appreciation for wildlife was rated on an index of six statements reflecting concern for the welfare of wildlife. All nine of the negative social impacts with which landowners agreed were directly or indirectly related to recreationists. They did not feel they should have to manage recreationists as part of being a private land manager. Landowners disagreed with suggested negative impacts from wildlife but felt that the most important positive impacts came from having wildlife on their property and that wildlife contributed to the quality of life in the Columbia Basin. Recreationists agreed with statements reflecting negative social impacts caused by recreationists, such as litter, inconsideration towards landowners, and respect of the landowner's right to control access to his property. Recreationists disagreed with the statement reflecting fear of possible danger from wildlife. The abundance of wildlife was an important consideration in participation by 94 percent of the recreationists. Recreationists agreed with five of the seven suggested elements of satisfaction associated with abundance of wildlife. Recreationists had significantly more appreciation for wildlife on the index than did landowners. Implications for management include promoting proper conduct by recreationists, continuing programs to gain public access to wildlife on private land, promoting wildlife management by private landowners, and providing sufficient numbers of wildlife to maintain the interest of the recreationist and allow for the harvest of diverse satisfactions from the experience. INTERIM REPORT OF THE GOVERNOR'S TASK FORCE ON WATER RESOURCES.
Kansas Water Resources Board, Topeka.
December 1977 83 p, 3 fig, 6 tab, 8 photo, 4 append.

Descriptors: *Kansas, *Water resources, *State governments, Water supply, Governments, Groundwater, Groundwater resources, Water resources development, Water quality, Surface waters, Environment.

The Governor's Task Force on Water Resources was charged with: (1) determining the key problems of water supply facing Kansas now and in the future; (2) examining the causes underlying these water supply problems; and (3) identifying options available to the state and local units of government for resolving such problems. This was essentially a progress report which provided some much needed background information on the groundwater resources of Kansas, an overview of the State's water management structure, an identification of management alternatives, and an outline of next year's study plan. Recommendations came from Subcommittees on Groundwater Management and Program Coordination, indicating the priority and attention the Task Force has given to the declining groundwater tables in Western Kansas and the splintered management of the State's eighty water resource programs. The two most significant concepts reflected in the listed recommendations were (1) the confirmation and reaffirmation that the responsibility for managing the State's groundwater resources should remain with local units of government, and (2) the leadership in coordinating the funding of the State's water resources programs should be a specific responsibility of the Kansas Water Resources Board. RESOURCE DEMANDS FOR ENERGY DEVELOPMENT IN THE YELLOWSTONE RIVER BASIN,
CH2M/Hill, Sacramento, CA.; and North Dakota State Univ., Fargo.
J. W. Knapp, and F. L. Leistritz.
Water Resources Bulletin, Vol. 14, No. 3, p 613-628, June 1978. 1 fig, 3 tab, 10 ref.

Descriptors: *Methodology, *Regional analysis, *Water demand, *Planning, *Energy, *Yellowstone River Basin, Economics, Forecasting, Water resources, Energy development, Analytical techniques, Mathematical models, Demand, Schedule, Systems analysis.

Reported is the development of a mathematical model for forecasting energy development in the Yellowstone study area for the years 1985 and 2000, and for determining the associated demands for water, land, labor, capital, and mineral resouces. The study was prepared for use by the Missouri River Basin Commission in conducting a comprehensive 'Level B' planning study of the wate and related land resources in the Yellowstone River Basin. The study results indicate that the amount of coal development in the study area will depend primarily upon state and federal energy policies and regulations. Policies related to slurry pipeline transportation of coal will be particularly important in determining the level and pattern of future energy development in the area. Coal production under the 'most probable' scenario is expected to increase from about 40 million tons in 1976 to 163 million tons per year by 1985, and 513 million tons in the year 2000. Consumptive water use for energy development in the study area could be as much as 556,000 acre-feet per year by the year 2000 (under the high scenario). A parametric analysis was conducted on the 1985 most proble scenario to determine the influence on the study results of variations in the delivered price of water. Water requirements were reduced by nearly one-fourth as water costs increased from zero to over $750 per acre-foot (Bell-Cornell)

6E. Water Law and Institutions

LAWS PASSED DURING THE 1976 SESSION OF THE MISSISSIPPI LEGISLATURE (CONCERNING MAINE AND COASTAL ZONE),
Mississippi Univ. Law Center, University.
Available from Univ. of Miss. Law Center, Oxford, Miss., Mississippi-Alabama Sea Grant Consortium. Report MASGP 77-010, 1976. 23p.

Descriptors: *Mississippi, *Legislation, *Coasts, *Environmental control, Floods, Hunting, Waterflow, Solid waste disposal, Port authorities, Water supply, Groundwater, Regulation.

This volume represents those laws that were passed during the 1976 Session of the Mississippi Legislature that would affect the use and development of the state's marine and coastal zone. Certain chapters pertain to general administration. Chapter 341 authorizes counties and municipal and private companies to participate in applicable approved regional solid waste disposal and recovery systems. Chapter 404 provides for posting of land subject to flooding. Chapter 173 empowers municipalities to erect, purchase, operate, and regulate waterworks Chapter 474 empowers the Mississippi Board of Water Commissioners to delineate capacity use areas of the state where it finds that the use of groundwater requires coordination and limited regulation for the protection of the interests and rights of property owners or the public. Chapter 342 provides for the transportation of solid wastes across Mississippi state lines, establishes ownership of solid wastes, and further regulates disposition of solid wastes. Chapter 452 designates the State Board of Health as the Drink Water supply Regulatory Agency, and outlines the Board's responsibilities. There are also some hunting regulations in this volume. (Horwich-Florida)

UNITED STATES SEAWARD JURISDICTION-POST, PRESENT, AND FUTURE,
Mississippi Univ. Law Center, University.
Available from Univ. of Miss. Law Center, Oxford, Miss. Mississippi-Alabama Sea Grant Consortium. Report MASGP 77-011, 1976. 23p.

Descriptors: *Law of the sea, *International law, *Jurisdiction, *International waters, Water rights, Fishing, Federal government, Submerged lands act, Oceans, Analysis, United States.

Seaward jurisdiction is in a state of great change Even though international negotiations on the Law of the Sea appear to be stalemated, proclamations by coastal nations are changing traditional patterns of ocean use. This paper is an analysis of the jurisdictional zones and how the United States is extending its jurisdiction. The old three-mile territorial sea concept, although still officially recognized by most nations, is being whittled away as certain types of authority--such as exclusive fishing rights--are extended well beyond the three-mile limit. An example is the 1976 United States Fishery Conservation and Management Act. These changes are best understood by extensions of certain rights traditionally associated with the narrow territorial sea, which may be described not only by reference to physical boundaries, but also with reference to certain rights. Concepts such as 'contiguous zone,' 'fishing zone,' and 'exclusive economic control zone' are all extensions of functions of the coastal state in the territorial sea, and represent shrinkage of the freedom of the high seas. Pressures for extension of coastal state jurisdiction in the ocean have been almost entirely economic--prompted by the desire to control natural resources. (Horwich-Florida)

LAWS PASSED DURING THE 1975 SESSION OF THE MISSISSIPPI LEGISLATURE (CONCERNING MARINE AND COASTAL ZONE),
Mississippi Univ. Law Center, University
Available from Univ. of Miss. Law Center, Oxford, Miss., Mississippi-Alabama Sea Grant Consortium. Report MASGP 77-009, 1975. 50p.

Descriptors: *Mississippi, *Legislation, *Coasts, *Marine animals, Pesticides, Oil wastes, Waste disposal, Regulation, Environmental control, Oysters, Hunting, Forestry.

This volume represents those laws that were passed during the 1975 Session of the Mississippi Legislature that would affect the use and development of the state's marine and coastal zone. Chapter 318 provides for the use and application of restricted use pesticides and to provide for the certification of applicators. Chapter 496 provides for the financing and construction of areawide waste disposal systems. Chapter 321 amends a 1972 Act and furnishes the Mississippi Marine Conservation Commission with jurisdiction and authority over all marine aquatic life. Chapter 308 allows for orderly marketing and easy consumer identification in the retail marketplace of catfish products produced or processed in Mississippi. Chapter 342 deals with the administration and enforcement of state oil and gas conservation laws. The state Oil and Gas Board has the duty to make rules and regulations--subject to the approval of the Mississippi Air and Water Pollution Control Commission--controlling the disposal of waste products brought to the surface from any oil, gas, or condensate well, and preventing seepage, overflow, or any other type of irreparable damage to the topsoil or surface area. (Horwich-Florida)
W79-02528

ACREAGE LIMITATIONS ON BUREAU OF RECLAMATION PROJECTS,
Hearing, Subcomm. on Public Lands and Resources, Comm. on Energy and Natural Resources, U.S. Senate, August 11, 1977, Publication No. 95-67, 111 p.

Descriptors: *Irrigation water, *Water allocation(Policy), *Water demand, *Evaluation, Water policy, Water permits, Water law, Legal aspects, Water utilization, Water supply, Water districts, Legislation.

The Senate Subcommittee on Public Lands and Resources hearing on acreage limitations on federal Bureau of Reclamation projects included consideration of soil, climate, and farming difference methods which affect comparative productive potential of irrigable lands. Testimony of landowners and officials of irrigation districts indicated the present 160 acre limitation applicable to Bureau projects was unreasonable because it was too small for many farmers to make a living with. Senate Bill 242 would provide an equivalency formula under which the Secretary of the Interior would have the authority to change the acreage limitations. The legislation would not change the class 1 soil-type 160 acre limitation, but an individual would be eligible to receive water for quantities of class 2, 3 or 4 land equal to 160 acres of class 1 soil. The present reclamation law was passed in 1902 when most farms were small and primitive farm machinery was used. However, modern farming methods are more efficient and only larger farms are profitable. The 160 acre limitation should be updated to reflect modern reality. All testimony given before the subcommittee is included. (Rule-Florida)
W79-02529

CERTAIN WATER RIGHT CLAIMS OF THE AK-CHIN INDIAN COMMUNITY,
Hearing, Select Committee on Indian Affairs U.S. Senate, July 25, 1977. 50 p.

Descriptors: *Arizona, *Indian reservations, *Water rights, *Federal government, Irrigation programs, Water utilization, Legal aspects, Aquifer systems, Recharge, Agriculture, Groundwater resources, Water supply development.

This U.S. Senate Select Committee on Indian Affairs (Committee) hearing addresses Senate Bill 1582 which attempts to make available a temporary water supply for the Ak-Chin Indian Community (Indians) in central Arizona, until a permanent supply can be developed. The bill provides that the Indians would waive all claims against the U.S. for the government's past failures as trustee to assert and protect the Indian's water rights--thereby avoiding costly litigation. The Indians have gone from abject poverty to self-sufficiency as a result of the farming of reservation land. The federal government has failed to supply the Indians with their 'Winter's' rights water. To survive, the tribe must pump water from the aquifer at increasing costs. This is causing the aquifer to drop 20-feet per year, resulting in a buckling of reservation lands. The Committee is addressed by a representative of the federal Department of the Interior and Resource Planning Officers from the Bureau of Reclamation. They suggest that a feasibility study of the potential water supply and development costs be undertaken prior to the bill's passage. The bill's authors respond to this suggestion stating the need for immediate action. All testimony given before the Committee, as well as maps and graphs are included. (Goldberg-Florida)
W79-02530

WATER RESEARCH AND DEVELOPMENT (BILLS TO AMEND THE WATER RESOURCES PLANNING ACT AND PROMOTE MORE RESPONSIVE NATIONAL WATER RESEARCH PROGRAM).
Hearing, Subcomm. on Water Resources of the Committee on Environment & Public Works, U.S. Senate, April 7, 1978. Serial No. 95-H54,474p.

Descriptors: *Legislation, *Federal government, *Water resources research act, *Water resources council, Water resources development, Administrative agencies, Comprehensive planning, Desalination, Saline water, Planning, Water policy.

The Subcommittee on Water Resources, part of the United States Senate's Committee on Environment and Public Works, held hearings in 1977 to discuss water research and development. Chaired by Senator Mike Gravel, from Alaska, the subcommittee specifically discussed proposed bills which dealth with the Water Resource Council and the 1974 Water Resources Research Act. Opening statements were made by Senators McClure and Domenici. Senator McClure, while acknowledging that the hearings focused on a bill to extend the life of the Water Resource Council for another year, urged approval of a bill which would change the existing structure of the Council. His alternate bill would place the Council in the White House and strengthen its authority over water resource agencies. The other bill discussed by Senator McClure would provide varied funds for water research programs. Senator Domenici's statements concentrated on desalinization programs. Included in the text are the proposed bills, in their entireties, which were discussed. After the opening remarks were made, witnesses were called to comment on and discuss the bills. FEDERAL CONSISTENCY WITH APPROVED COASTAL MANAGEMENT PROGRAMS,
Federal Register, Vol. 43, No. 49, p 10510-33, March 13, 1978. 1 tab.

Descriptors: *Coastal plains, *Federal government, *Administrative decisions, *Adoption of practices, Administrative agencies, Legislation, Regulation, Management, Permits, Continental shelf, Exploration, Environmental effects.

These final regulations provide coastal states, federal agencies, and other affected parties with policies and procedures for the implementation of the federal consistency provisions of the 1977 Coastal Zone Management Act, as amended. These regulations are issued by the National Oceanic and Atmospheric Administration (NOAA). The NOAA has attempted to minimize the likelihood of unnecessary delay in the administration of federal programs. However, the NOAA has favored comprehensive and complex coverage over simplicity to avoid uncertainty and conflict. The NOAA is still committed to the goal of implementing a federal consistency system which not only promotes the substantive coastal management purposes of the Act but also fosters the Act's objective of expeditions intergovernmental coordination. A matrix diagram which makes distinctions among the various types of federal actions subject to the Act's federal consistency requirements is included. A detailed discussion of specific comments and the NOAA's responses is also included. It was determined that environmental and inflationary impact statements were not required in this instance. COASTAL ZONE MANAGEMENT APPROVAL REGULATIONS,
Federal Register, Vol. 43, No. 41, p 8378-8342, March 1, 1978. 6 tab.

Descriptors: *Coastal plains, *Federal government, *Administrative decisions, *Adoption of practices, Administrative agencies, Development, Management, State governments, Regulation, Planning, Natural resources, Water quality.

The National Oceanic and Atmospheric Administration (NOAA) has promulgated these interim final regulations seeking to revise and incorporate several sets of existing regulations dealing with development and approval of state coastal management programs. These regulations reflect more accurately the interpretation of program approval requirements being provided by the Office of Coastal Zone Management. The NOAA also wishes to respond to requests to discuss further some of the major issues addressed in the regulations prior to their finalization. Such an open process follows the spirit of the 1972 federal Coastal Zone Management Act, as amended. The interim final regulations include a discussion of the major issues and a section-by-section discussion of other comments received. Some reviewers felt the regulations did not adequately reflect the goal of preservation of unique coastal resources. Changes were made to emphasize the relationship between the proposed energy facility planning requirements and national interest considerations. The treatment of local programs is explored. The NOAA agreed that a more detailed performance review should be provided after program approval. If states have more stringent pollution control standards, these must be incorporated into the management program. (Quarles-Florida)

TIDELANDS AND THE PUBLIC TRUST: AN APPLICATION FOR SOUTH CAROLINA,
B. W. Wyche.
Ecology Law Quarterly, Vol. 7, No. 1, p 137-70, 1978.

Descriptors: *Coastal marshes, *Ownership of beds, *Intertidal areas, *South Carolina, Tidal marshes, Marshes, Wetlands, State jurisdiction, Riparian rights, Public benefit, Environmental control, Judicial decisions.

Tidelands of coastal states are now recognized as resources of immense public value. As a means of protecting these lands against abuse and destruction, courts generally apply the public trust doctrine: tidelands, as well as lands underlying navigable, non-tidal waters, are held in trust for the benefit of the public. Whether tidelands are held in trust in South Carolina is open to question. The state is the presumptive owner of all South Carolina tidelands, but a private claimant can rebut this presumption by producing an unbroken chain of title back to an original grant from the sovereign and by showing specific language in the grant evincing the intent to convey the land to the mean low water mark. However, the South Carolina Supreme Court has declared in dicta that tidelands are held in trust for public purposes. This position is consistent with common law principles and decisions of state courts and the United States Supreme Court. However, the South Carolina Supreme Court has not defined or explained the scope, nature, and limitations of the tidelands trust. Presumably the trust encompasses all tidelands, not just those abutting navigable waters. (Rule-Florida)

NEGLECTED MARINE SANCTUARY LAW IS SHOWING SIGNS OF LIFE,
D. Laist.
Audubon, Vol. 83, No. 3, p 117-19, 1978.

Descriptors: *Legislation, *Aquatic life, *Protection, *Preservation, Marine animals, Ecosystems, Great lakes, Continental shelf, Coasts, Administrative agencies, Marine plants, Conservation.

Title III of the 1972 Marine Protection, Research, and Sanctuaries Act could prevent the despoliation of many of our nation's most valuable offshore areas. Title III calls for the establishment of marine sanctuaries, and after almost five years of neglect, the law is showing signs of vitality. The law provides authority for presidential approval of sanctuaries, and after almost five years of neglect, the law is showing signs of vitality. The law provides authority for presidential approval of sanctuaries: as far seaward as the edge of the continental shelf, in other coastal waters subject to the ebb and flow of the tide and in the Great Lakes and their connecting waters. The five categories of marine environment that can justify sanctuary status are: (1) habitat areas; (2) species areas; (3) recreation and esthetic areas; (4) research areas; and (5) unique areas. The operation of the marine sanctuaries program is discussed, as is its history. The author offers several explanations of why, until recently, the program has progressed at a slow pace. The turning point for the present brighter outlook for the program is attributed to President Carter's support for it in his 1977 environmental message. Since then, the program has been funded and administered by the National Oceanic and Atmospheric Administration. (Horwich-Florida)
W79-02540

STATE LAW CONTROLS TITLE TO ALLUVIAL FORMATIONS EVEN THOUGH ORIGINAL TITLE IS BASED ON EQUAL-FOOTING DOCTRINE OR FEDERAL GRANT,
J. L. Ross.
Texas Tech Law Review, Vol. 9, No. 2, p 381-91, Winter, 1977-78.

Descriptors: *Federal-state water rights conflicts, *Alluvium, *Accretion(Legal aspects), *Riparian rights, Legal aspects, Water law, Water policy, Federal jurisdiction, Water rights, Ownership of beds, Judicial decisions, Analysis.

Under the United States Supreme Court case of Oregon ex rel. State Land Board v. Corvallis Sand and Gravel Company, state law controls title to allovial formations even though original title is based on the equal-footing doctrine or federal grant. Even though the case was argued in terms of correct application of federal common law, the court decided the jurisdictional question of whether state or federal law should control title determinations of modified riverbed lands. State law should control unless some theory or factual situation indicates that federal grant claims did not govern. The decision to overrule Bonelli Cattle Company v. Arizona, which based federal jurisdiction of the equal-footing doctrine, was sound. However, the decision on federally granted riparian land was faulty because the court failed to distinguish between riparian rights associated with a federal grant and the equal-footing doctrine as possible sources of federal jurisdiction. Instead of deciding whether the facts contained an accretion issue, the court applied the same rational to grants that it did to the doctrine. (Rule-Florida)

CALIFORNIA'S PROGRAM FOR DEALING WITH THE DROUGHT,
California State Dept. of Water Resources, Sacramento.
R. B. Robie.
Journal of the American Water Works Association, Vol. 70, No. 2, p 64-68, 1978.

Descriptors: *California, *Water shortage, *Remedies, *Droughts, Precipitation(Atmosphere), Reservoir storage, Water supply, Water storage, Groundwater basins, Surface waters, Water conservation, Drought tolerance.

Recently, California, along with much of the West, experienced some of the most severe drought conditions ever experienced. Nevertheless, California has been able to cope with the drought and may even be in a better position to prepare for future dry periods. California generally has only one rainy season each year, so numerous reservoirs have been built to store the runoff. As a result of the drought, groundwater levels around the state have dropped drastically. Agriculture and closely related industries have been hardest hit by the drought. Water rationing has been implemented in many urban areas. Other problem areas affected by the drought include fires, fish and hydroelectric power. The state Department of Water Resources has learned several lessons from the drought, and these are set forth. California has taken a number of actions to cope with the drought. The Governor's Drought Emergency Task Force was created. Many communities embarked upon voluntary and mandatory local conservation programs. Water exchanges and temporary diversions were arranged. The Department of Water Resources initiated a cloud seeding program. Other specific plans to cope with the continued drought are also set forth. (Quarles-Florida)

ENVIRONMENTAL REGULATION OF UNITED STATES DEEP SEABED MINING,
Marshall-Wythe School of Law, Williamsburg, VA.
S. C. Whitney.
William and Mary Law Review, Vol. 19, No. 1, p 77-97, Fall, 1977.

Descriptors: *International waters, *Mining, *Exploitation, *Law of the Sea, United States, Regulation, Manganese, Technology, United nations, Oceans, Negotiations.

The deep-sea mining of managanese nodules is inevitable given increasing industrial demands and available economic and technological resources. This article concludes that Congress should enact legislation providing a guaranteed security for corporate investment and effort subject to compliance with sound regulatory and environmental principles. The author also suggests that an effort should be made to influence foreign countries to adhere to sound environmental safeguards in order to advance the goal of efficient, responsible exploitation of the seabed's natural resources. This could be accomplished through bilateral negotiations and agreements which could provide a basis for the emergence of favorable customary international law that would promote the negotiation of a viable Law of the Sea agreement. This article examines the nature of deep seabed mining and proposes a legislative framework within which commercial mining ventures could operate effectively. The article then discusses the problems which the United States faces when attempting to promote responsible development of deep-sea mining in a hostile international community. The international environment regime of law which will control exploration and exploitation until a Law of the Sea treaty is finalized, is also discussed. (Quarles-Florida)

THE SEABED NEGOTIATION AND THE LAW OF THE SEA CONFERENCE -- READY FOR A DIVORCE,
J. T. Smith, II.
Virginia Journal of International Law, Vol. 18, No. 1, p 42-59, Fall 1977.

Descriptors: *Law of the sea, *United nations, *Resource allocation, *Negotiations, International waters, Oceans, Continental shelf, Natural resources, Mining, United States, Exploitation, International law.

The procedural and substantive obstacles to successful conclusion of the seabed negotiations of the Third United Nations Conference on the Law of the Sea are so large that means must be found to divorce them from the rest of the Conferences work. This is the conclusion of this article which warns that, absent such a separation, the success of the entire Conference may be jeopardized. The most overt sign of restlessness in this area of negotiation has been the United States' statement that the portion of the new informal Composite Negotiating Text dealing with the seabed regime is fundamentally unacceptable. While the United States undertakes a serious review of conference substance and procedures, Congress is preparing legislation which will encourage American firms to mine the seabed despite the absence of an agreed-upon international regime. Other nations are also growing anxious over this troubled area of negotiation. The article examines the procedural failure of the Conference and the substantive obstacles of the seabed negotiations. Alternatives for resolving the seabed roadblock are suggested with a detailed plan of divorcing the seabed negotiations from the Conference. (Quarles-Florida)

SUBSIDENCE OF LAND CAUSED BY WITHDRAWAL OF PERCOLATING WATER IS ACTIONABLE ON THE THEORIES OF NEGLIGENCE AND NUISANCE IN FACT,
E. L. Huddleston.
Texas Tech Law Review, Vol. 9, No. 2, p 392-401, Winter 1977-78.

Descriptors: *Texas, *Judicial decisions, *Water rights, *Remedies, Nuisance, Negligence, Groundwater, Percolating water, Subsidence, Natural flow doctrine, Reasonable use, Land subsidence.

In Smith-Southwest Industries v. Friendswood Development Co., the Houston (Texas) Court of Civil Appeals held that subsidence of land caused by withdrawal of percolating water is actionable on the theories of negligence and nuisance in fact. Texas water law follows the English rule which allows a landowner to withdraw unlimited amounts of water without liability for injury to a neighbors well. However the tort law of negligence and nuisance can impose liability for subsidence of land. A person who uses his land in a negligent manner and causes injury to another's property is liable for their negligence. And to find a nuisance, a court weighs the injury to the plaintiff against the reasonableness and usefulness of the defendant's activity. Although the Houston court indicated that it solved the contradictions between the two laws--water law and tort law--by blending them, the author maintains that the court simply ignored the English rule, and recommends the Texas Supreme Court solve this conflict by abandoning the English rule completely. While the English rule may have been practical in earlier days, it has been rendered obsolete by societal changes. (Horwich-Florida)

EQUAL FOOTING DOCTRINE DOES NOT REQUIRE APPLICATION OF FEDERAL COMMON LAW TO RESOLVE OWNERSHIP OF LAND UNDERLYING NAVIGABLE WATERWAYS WHICH ARE NOT INTERSTATE BOUNDARIES,
C. E. Hagberg.
Tulsa Law Journal, vol. 12, no. 3, p 593-99, 1977.

Descriptors: *Riparian land, *Ownership of beds, *Judicial decisions, *Avulsion, River beds, Navigable waters, Common law, Federal-state water rights conflicts, Accretion(Legal aspects), Submerged lands act, Oregon, State jurisdiction.

In Oregon ex rel State Land Board v. Corvallis Sand and Gravel Co., Oregon brought an ejectment action, claiming title to two parcels of land. The first parcel had been part of a riverbed since before Oregon was admitted to the Union. The second became a riverbed in 1909, after statehood, following a major flood. The trial court--affirmed by the Oregon Court of Appeals--awarded ownership of the first parcel to the State. The 'equal footing doctrine' requires that newly admitted states acquired title to the riverbeds of all navigable waterways within their boundaries. The court applied the federal common law theory of avulsion to the second parcel and awarded it to the defendant. The case was reversed by the United States Supreme Court, which also reversed its former policy of expanding the situations where federal common law would apply. Thus state law shall govern the impact of accretion, avulsion, and reemergence upon ownership of land surrounding or underlying navigable waterways that do not form interstate boundaries. The author defends this decision, because states have unique interests in, and varying public policies with respect to, riparian lands. (Horwich-Florida)
W79-02551

SURFACE WATER FLOODING IN URBAN AREAS: RIGHTS AND REMEDIES UNDER THE COMMON ENEMY DOCTRINE,
J. P. George.
Tulsa Law Journal, Vol. 12, No. 3, p 574-92, 1977.

Descriptors: *Surface runoff, *Remedies, *Urban drainage, Floods, Common law, Urban runoff, Land development, Drainage effects, Urban development, Drainage.

Urban flooding is an ever increasing problem as land development intensifies in expanding metropolitan areas. Surface runoff can submerge land not ordinarily considered subject to flood damage. This article examines common law remedies available to resolve surface water drainage problems as exemplified in three geological situations. Its scope is limited to jurisdictions employing the modified common-enemy doctrine. The three situations are: (1) when the landowner is on the lower end of a watershed and upper development causes increased runoff velocity or volume; (2) when the landowner occupies a depression and subsequent development causes standing or slow draining water; and (3) when the landowner is the recipient of collected artificial discharge from another landowner. The artificially collected discharge generally involves negligence and a lack of good faith. Available remedies are injunctive relief, damages, or both. But the single lot depression and the increased general runoff problems usually present situations where no cause of action will lie unless the damaged party can show lack of care, excessive damage or malice, or can demonstrate that a

more adequate drainage system is feasible. This is because these problems arise from normal urban growth. (Horwich-Florida)

SOMETHING OLD, SOMETHING NEW: SOME THOUGHTS ON GROTIUS AND THE MARINE ENVIRONMENT,
J. Schneider.
Virginia Journal of International Law, Vol. 18, No. 1, p 147-64, Fall 1977.

Descriptors: *Law of the sea, *International law, *United Nations, *Conferences, International waters, Exploration, Exploitation, Compensation, Appropriation, Political aspects, Regulation.

The United Nations has had three conferences on the Law of the Sea (UNCLOS). Discussed here are the proposals and faults of the Third Conference (UNCLOS III) which took place in 1978. Coastal states will have, according to the proposals, sovereign rights for the purpose of exploring and exploiting, conserving and managing the natural resources, whether living or non-living of their 200-mile economic zone. However, there shall be preserved in all 'economic zones' the traditional high seas freedoms for all states, such as navigation and overflight and of the laying of submarine cables and pipelines. The author criticizes the Convention for not adequately recognizing problems relating to the marine environment. The proposal states that in exercising its prerogative in this area, a coastal state must not hamper innocent passage of any other state's vessel. It can only prevent passage which is not innocent, which has traditionally meant only passage which is not prejudiced to the peace, good order or security of the coastal state. The author argues that pollution should be security of the coastal state. The author argues that pollution should be included in the category of 'not innocent.' Environmental protection must be given a more important place in attempts at international cooperation. (Horwich-Florida)

PROTECTING THE CALIFORNIA COAST.
Sierra Club Bulletin, Vol. 63, No. 5, p 11-12, June, 1978.

Descriptors: *California, *Coasts, *Planning, *Land development, Legislation, State governments, Permits, Conservation, Sewage, Beaches, Dredging, Wetlands.

Protecting the California coast from unrestricted development has not been an easy task. The turning point in the battle was the creation in 1965 of the San Francisco Bay Conservation and Development Commission. The Commission was the catalyst and model for a state-level coastal conservation program in the 1970's. The 1972 Coastal Initiative was finally passed to enact a statewide coastal protection law. The 1972 Coastal Act did not halt all coastal development but it did alter future coastline development. The law's most important effect was to enable the state to acquire parklands in desirable areas previously dominated by private landowners. Another result of the law was the preparation of the 1975 California Coastal Plan which stresses the idea that the coast should be treated as a unique place, where conservation has priority. Upon the expiratin of the 1972 Act in 1976, a weakened Coastal Act was passed, establishing a permanent California Coastal Commission. The Commission must rely on local governments and state and federal agencies to implement the new Act. The program has presently reached a critical point, with numerous controversies and opposition surrounding it. (Quarles-Florida)

ESTABLISHING LIABILITY FOR DAMAGE RESULTING FROM THE USE OF UNDERGROUND PERCOLATING WATER: SOUTHSOUTHWEST INDUSTRIES V. FRIENDSWOOD DEVELOPMENT COMPANY,
D. A. Wright.
Houston Law Review, Vol. 15, No. 2, p 454-68, January 1978.

Descriptors: *Texas, *Subsurface waters, *Reasonable use, *Judicial decisions, Damages, Percolating water, Withdrawal, Water levels, Negligence, Water rights, Groundwater, Subsidence.

Texas landowners brought a class action suit against a corporation alleging that the withdrawal of large quantities of percolating, subsurface water from beneath defendant company's land caused a severe subsidence of plaintiff's property. The trial court granted defendant's motion for summary judgment on the basis of the common law rule that a landowner has an absolute right to the water beneath his property. The appeals court reversed, stating the plaintiffs had a right of action based upon negligence and nuisance. The author views this decision as contrary to common law doctrine. The rationale for the seemingly harsh rule is explained and its adoption by Texas courts is traced. However, the majority of other states follow the doctrine of reasonable use. The various rules relating to property rights in subterranean waters are examined in some detail. The article urges the Texas Supreme Court to adopt the second of three options available in this water rights area: (1) make the absolute-use doctrine subject to tort liability for negligence; (2) adopt the doctrine of reasonable use; or (3) recognize that the common law rule was never intended to deal with situations where the damage was land subsidence. (Quarles-Florida)

ORGANIZING FOR A NATIONAL OCEANS PROGRAM,
Virginia Univ., Charlottesville. School of Law.
J. N. Moore.
William and Mary Law Review, Vol. 19, No. 1, p 1-15, Fall, 1977. 4 app.

Descriptors: *Oceans, *Administrative agencies, *United States, *Water conservation, Beaches, Legislation, Natural resources, Continental shelf, Federal government, Mining, Planning, Water policy.

Without a national oceans policy, the United States will continue to drift toward increased pollution of its beaches and lagging oceans development. Although great strides have been made toward the development of a national oceans program, we have reached a critical point in oceans policy. The principal organizational needs of a national oceans policy are: (1) upgrading the attention given the oceans in overall national priority; (2) development of national oceans goals and implementation programs; (3) centralization of oceans programs; and (4) more effective interagency coordination and Presidential oversight of programs. In order to reduce organizational weaknesses and build toward a national oceans program, the author suggests three modest changes: (1) creation of a Cabinet-level Marine Affairs Council to develop national ocean goals; (2) creation of an independent centralized agency reporting directly to the President; and (3) reorganization of the State Department's oceans effort into a genuine Bureau of Oceans and Environment. The basic reason given for these proposed changes is the lack of clear oceans goals in the nation's present policy. Diagrams illustrating the proposed organization of the author's suggestions are included. (Quarles-Florida)

HODGES V. OKLAHOMA WATER RESOURCES BOARD (WATER RESOURCES BOARD GRANT OF TEMPORARY PERMIT FOR NON-DOMESTIC GROUNDWATER USE UPHELD).
580 P. 2d 980-83 (Okla., 1978).

Descriptors: *Irrigation water, *Beneficial use, *Domestic water, *Oklahoma, Preferences(Water rights), Water permits, Administrative decisions, Water demand, Water districts, Competing uses, Water distribution(Applied), Water allocation(Policy).

Appellees Oklahoma Water Resources Board and permit applicant appealed a trial court ruling which reversed the Board's order granting a temporary permit to take and use ground water for spray irrigation. The trial court held that the Board's findings of a beneficial use and lack of waste were not supported by substantial competent evidence. The court also felt the Board had failed to address appellant local resident's argument that domestic ground water uses have priority, and the permit use would have a detrimental effect on domestic uses. Reversing the trial court, the Oklahoma Supreme court reinstated the Board order and held that spray irrigation could be a beneficial use, and that once an applicant shows what method he intends to use for irrigating a particular area, the Board has the authority to determine that a waste will or will not occur. Protestors who feel waste will occur must present their evidence to the Board. In this case, such evidence presented was deemed inconclusive. Additionally, the Supreme Court held that simply because it is not necessary to obtain a permit before taking water for domestic uses does not mean such uses have priority over water put to other beneficial use. (Rule-Florida)
W79-02557

BUTTS V. CITY OF SOUTH FULTON (CONSTRUCTION OF ROAD WHICH INTERFERED WITH NATURAL DRAINAGE AND CAUSED FLOODING CONSTITUTED ACTIONABLE NUISANCE).
565 S.W. 2d 879-83 (Tenn. Ct. App. 1977).

Descriptors: *Alteration of flow, *Flood damage, *Surface drainage, *Tennessee, Roads, Drainage, Surface runoff, Rain water, Surface waters, Flood control, Damages.

Plaintiff property owner brought action for money damages resulting from contruction of a road which interfered with natural drainage and caused water to back up and flood his land. The property had never been flooded or damaged by flood water before the construction. Defendant municipality had been informed that the lack of adequate drains could cause water back-up, but failed to install additional tiles to carry off the water. As a result, the road formed a dam which blocked the natural flow of water. When large amounts of rain fell, the water accumulated and flooded plaintiff's property. The Tennessee Court of Appeals held that wrongful interference with natural drainage of surface water which causes injury to an adjoining landowner constitutes an actionable nuisance. The court affirmed the trial court award of damages, but reversed an order requiring defendant to lower the road level or to install a pump and submit plans for removing water. The appeals court felt the order placed the trial court in a supervisory position for which it had not expertise, and that there were alternative remedies available. (Rule-Florida)
W79-02558

RULES AND PROCEDURES FOR APPLICATION FOR COASTAL CONSTRUCTION PERMITS.
Florida Dept. of Natural Resources, Tallahassee. Div. of Marine Resources.
Fla. Admin. Code, Ch 16B-24, secs 24.01 thru 24.09 (1978).

Descriptors: *Permits, *Florida, *Regulation, *Coastal structures, Legislation, Project planning, Administrative agencies, Construction, Coasts, Engineering, Beaches.

In pursuance with Florida statutes, these rules are promulgated to implement departmental policies and procedures for applying for any coastal construction permit. The regulations described herein deal with the permit application process and with conditions placed on such permits. Generally, no erosion control structure may be constructed or modified unless a valid permit has been issued by the Department of Natural Resources (Department). This rule does not apply if the Department's Division of Marine Resources determines that the activity is not covered by the regulations. In order to obtain a permit an application must be submitted

to the Bureau of Beaches and Shores (Bureau). Information such as evidence of ownership as to the land in question and a set of contruction plans must be included. All applications must be accompanied by a fee, unless the applicant is a governmental unit. If the project is acceptable, notice will be mailed to parties interested in the proposed structure in order to obtain their recommendations. Later, the Bureau shall make its final recommendations. Accepting a permit imparts a duty on the applicant to follow all permit conditions imposed by the Department. (Spiegel-Florida)
W79-02559

NIAGRA OF WISCONSIN PAPER CORP. V. WISCONSIN DEPT. OF NATURAL RESOURCES (STATE EFFLUENT DISCHARGE PERMITS MUST BE MODIFIED IN ACCORDANCE WITH STATE LAW TO COMPLY WITH EPA STANDARDS.
268 N.W. 2d 153-64 (Wis. 1978).

Descriptors: *Effluents, *Federal water pollution control act, *Permits, State jurisdiction, Regulation, Water quality standards, Pollution abatement, Technology, Phosphates, Waste water treatment, Industrial wastes.

Two paper companies instituted actions against the Wisconsin Department of Natural Resources (DNR) when the DNR refused to alter Wisconsin Pollution Discharge Elimination System permits it previously issued to the companies. The permits incorporated interim effluent limitations based upon guidelines published by the federal Environmental Protection Agency (EPA), and were to be in effect until 1978. However, the permits were to be modified in 1977 following the EPA's scheduled adoption of 'best practicable control technology currently available' effluent limitation standards. The final standards adopted by the EPA in 1977 were less stringent than those in the original DNR permit. The state supreme court held that because of a state law requiring that DNR rules relating to effluent limitations shall comply with and not exceed the 1977 EPA requirements, the original permits should have been modified to comply with the less stringent and final 1977 EPA standards. Finally, noting the difference between effluent limitations and water quality standards, the court ruled a phosphorus limitation in the permit could not be retained unless the DNR could link its necessity to an actual water quality standard violation. (Easterbrook-Florida)
W79-02560

OKLAHOMA WATER RESOURCES BOARD V. CITY OF LAWTON (SPRINGWATER HEATED AS STREAM WATER FOR APPROPRIATION PERMIT APPLICATION),
580 P. 2d 510-14 (Okla. 1978).

Descriptors: *Oklahoma, *Competing uses, *Appropriation, *Spring waters, Administrative agencies, Streams, Water users, Water consumption(Except consumptive uses), Permits, Land development, Irrigation, Municipal water.

A private landowner was granted a temporary permit to appropriate 400 feet of ground water annually for recreation, housing development and commercial irrigation uses by the Oklahoma Water Resources Board. Lawton city officials objected, claiming the water to be appropriated was part of the watershed that would normally drain into the lake which supplied the city with water. A trial court reversed the Board. Affirming the trial court, the state supreme court held that even though the water to be appropriated came to the surface in the form of a spring and ran across the surface in a nondefinite course for such a short distance it did not constitute a 'definite' stream, it could nevertheless only be appropriated as stream water, not ground water. And, to appropriate stream water, the court noted the Board must make certain statutory determinations, including: (1) there is unappropriated water available in the amount applied for; (2) a present or future need for the water exists, and the proposed water use is a beneficiticial use; and (3) the proposed use does not interfere with domestic or existing appropriative uses--like that of Lawton. (Easterbrook-Florida)
W79-02561

KUIPER V. WARREN (CONDITIONAL WELL PERMIT OWNER MUST APPLY WATER TO BENEFICIAL USE OR LOSE PERMIT).
580 P. 2d 32-36 (Colo. 1978).

Descriptors: *Colorado, *Well permits, *Well regulations, *Beneficial use, Water supply, Standards, Regulation, Administrative decisions, Water users, Groundwater, Unappropriated water.

Defendant, the holder of a conditional well permit, was ordered by the Colorado Ground Water Commission to cease operation of the well because the permit under which it had been constructed had expired. The expiration occurred because the defendant permit holder had failed to apply the well water to a beneficial use within the time period stipulated in the permit. When the well operator refused to comply with the Commission's order, plaintiff state engineer was granted injunctive relief by a trial court that ordered the well owner to stop using the well. In affirming the Commission's and trial court's decisions, the state supreme court ruled that the appropriator was required to place the water to a beneficial use within the time prescribed by the permit statute; that the statutory time provisions in the designated ground water context did not impremissibly limit the constitutional right to appropriate unappropriated waters; and that the Commission had not acted in an arbitrary or discriminatory fashion when it enforced the time limit, contrary to the defendant's claim that numerous other well permit owners had not had the time limit enforced against their appropriations. (Easterbrook-Florida)
W79-02562

BAUER V. PRESTWICH (USE OF WATER ON LAND MAKES IT APPURTENANT TO THE LAND).
578 P. 2d 1283-86 (Utah 1978).

Descriptors: *Utah, *Water rights, *Spring waters, *Adjacent land owners, Unappropriated water, Springs, Water uses, Water demand, Competing uses, Judicial decisions, Groundwater availability.

Private landowner brought an action against defendant adjacent landowners seeking to quiet title to waters of a spring on his land and to enjoin defendants from using the spring water. The trial court quieted the title and enjoined defendants from interfering with plaintiffs rights to use the water. Affirming the trial court ruling, the Utah Supreme Court held that the use of water upon a tract of land makes it appurtenant to that land, and, unless the right to the water was separately deeded away, the right to the water would pass with the land. Here, the water from this spring was found to have been used continuously by plaintiff and his predecessors in interest since before 1903--a sufficient period of time to render the right to the water appurtenant to the land and to validate plaintiff's assertion of a 'diligence claim' to the water. A similar 'diligence claim' to the water by defendant was denied because of a lack of proof that the initial use of water prior to 1903 was every conveyed to defendant. Two justices dissented to the decision. (Easterbrook-Florida)
W79-02563

YOUGHIOGHENY RIVER-DESIGNATION AS A WILD RIVER; MINING OF MINERALS; RULES GOVERNING USE AND DEVELOPMENT; FUNDS TO PURCHASE PROPERTY.
Md. Code Ann. secs 8-408 thru 8-410 (1974), as amended, (Supp. 1976).

Descriptors: *Maryland, *Legislation, *Wild River Act, *Regulation, Administrative agencies, Planning, State governments, Mining, Zoning, Strip mines, Scenic easements, Wild rivers, Eminent domain, River regulation, Condemnation, Adjacent land owners.

The Youghiogheny River between Millers Run and the city of Friendsville is designated a wild river. Strip mining or open-pit mining is prohibited in this river, except for areas which have already been mined and are not reclaimed. The area designated as scenic shall be confined to adjacent land areas visible from the river or its shore. Development of scenic areas adjacent to the river shall be regulated by the Department of Natural Resources after review by the local advisory board and the Scenic and Wild rivers Review Board. Development includes any structure, addition or alteration placed or constructed on land or water. If any Department rules or statutory prohibitions under the Scenic and Wild River Program result in the taking of a property right without just compensation, the property so taken shall be paid for. Funds from the Program Open Space may be used for this purpose if the acquisition has been previously approved by the General Assembly. (Molloy-Florida)
W79-02564

SHORE EROSION CONTROL.
Md. Code Ann. sec 8-1005 (1974), as amended, (Supp 1976).

Descriptors: *Maryland, *Erosion control, *Financing, *Loans, Beach erosion, Legislation, Construction, Land management, Adjacent land owners, Local governments, Diversion structures, Tax rates, Interest, Assessments, State governments, Real property, Property values.

The Shore Erosion Control Construction Loan Fund is created to provide interest-free loans to individuals or local governments for construction of shore erosion structures. The state shall levy a special real estate tax on private property benefited by erosion control projects, and these monies shall be considered repayments of principal on loans from the Fund. This tax shall be levied by agreement between state and property owner for a period not exceeding 25 years, to compensate the state for project construction cost. Annual appropriation of general funds may also be added to the Fund to insure an effective yearly construction program. Approved projects may receive loans for 100 percent of the first $40,000 of cost, 50 percent of the next $20,000 of cost, 25 percent of the next $20,000 and 10 percent of construction costs exceeding $80,000. If two or more property owners are included within a single project and project construction cost exceed $80,000, the land of each is considered separately for computing net project construction cost under this formula. (Molloy-Florida)

BOHEMIAN BRETHREN PRESBYTERIAN CHURCH V. GREEK ARCHDIOCESAN CATHEDRAL OF THE HOLY TRINITY (RUNOFF DAMAGE RESULTING FROM GRADING OF ADJOINING PROPERTY).
405 N.Y.S. 2d 926-29 (Sup. Ct. 1978).

Descriptors: *Reasonable use, *Relative rights, *Surface runoff, *New York, Alteration of flow, Natural flow doctrine, Water law, Urban runoff, Rainfall, Storms, Damages.

Plaintiff church sought $150,000 for damages allegedly resulting from surface water runoff flowing from defendant church's property onto plaintiff's adjoining property. Defendant admitted it altered its property, but claimed the improvements were made to fit the property for a reasonable and rational use. Consequently, in a pretrial motion, defendant soughts dismissal of the suit, claiming plaintiff had not stated a cause of action requiring a trial. The New York trial court noted this suit raised the legal question as to the extent to which a land owner may cast off surface water onto the property of his neighbor. Three theories were examined. Under the natural flow theory, the owner of land who interferes with the natural flow of water is liable for damages caused to lower land. Under the common enemy rule, each owner has the absolute right to cast off waters from his land as he sees fit. In finding that the plaintiff had stated

a valid cause of action, the Court held that the reasonable use theory--under which a landowner who alters the flow of surface waters is liable for injury when his interference is unreasonable--must be applied in New York. (Stump-Florida)
W79-02566

IN RE WATER RIGHTS OF THE CIBOLO CREEK WATERSHED (LANDOWNER'S CLAIM OF EQUITABLE RIPARIAN WATER RIGHTS DENIED).
568 S.W. 2d 155-59 (Tex. Ct. App. 1978).

Descriptors: *Texas, *Water rights, *Riparian rights, *Irrigation practices, Streams, Competing uses, Water users, Water demand, Administrative decisions, Watershed management, Water distribution(Applied), Irrigation water.

The owner of two tracts of land on Cibolo Creek initiated an administrative adjudication of his water rights before the Texas Water Rights Commission. The adjudication was authorized by the state's Water Rights Adjudication Act (Act). One tract, located in Wilson County, was found to have a right to 80-acre feet based upon prescription and equity. The second tract, located in Guadalupe County, was found to have no recognizable water right. After dismissing the landowner's attack on the constitutionality of the Act, the review court held that in the absence of specific grants of irrigation water rights, land acquired under under Spanish and Mexican land grants--as were the two tracts here--do not have appurtenant riparian irrigation rights. The courts also held that the owner of a tract which had been irrigated with water from the creek for many years did not have a vested equitable right to creek water for irrigation. Finally, the court ruled that the state, or its predecessor soverignty, is the source of all titles; consequently, there exists a presumption of ownership in favor of the state until a claimant can show a valid grant of water rights out of the soverignty. (Easterbrook-Florida)
W79-02567

PETERSON V. GROUND WATER COMMISSION (EVIDENCE OF OVERAPPROPRIATED GROUND WATER RESOURCES SUFFICIENT TO DENY WELL CONSTRUCTION PERMIT APPLICATION).
579 P. 2d 629-35 (Colo. 1978).

Descriptors: *Colorado, *Groundwater resource, *Well permits, *Hydrograph analysis, Groundwater availability, Well data, Water rights, Administrative decisions, Hydrographs, Appropriation, Unappropriated water, Water level fluctuations.

Plaintiff landowner appealed a Colorado Ground Water Commission decision denying him permission to construct a well and to appropriate designated ground water from the Northern High Plains Designated Ground Water Basin. The permit application was denied when the Commission determined that water within a three-mile circle of the proposed well site was over appropriated and that the proposed well would unreasonably impair existing water rights. Affirming the denial, the state Supreme Court held that prior appropriators are entitled to protection against unreasonable impairment of their rights under the state's Ground Water Management Act, regardless of their decision to make an objection or not. Although the Court specifically disapproved of certain Commission application processing/permit granting procedures, it concluded that hydrograph interpretation evidence offered by expert witnesses for the Commission was sufficient to conclude that unappropriated water did not exist, and that plaintiff's well would unreasonably impair existing water rights in plaintiff's 'circle.' Even though the Commission's and lower court's use of the disapproved procedures was deemed to be erroneous by the Court, the error was not sufficient to reverse the permit application denial. (Easterbrook-Florida)

CONCERNED CITIZENS FOR ORDERLY PROGRESS V. COMMONWEALTH OF PENNSYLVANIA, DEPT. OF ENVIRONMENTAL RESOURCES (SEWAGE FACILITY CONSTRUCTION PERMIT UPHELD).
387 A. 2d 989-95 (Pa. Commw. Ct. 1978).

Descriptors: *Pennsylvania, *Sewage treatment, *Sewers, *Overland flow, Sewage disposal, Water pollution sources, Discharge(Water), Flood flow, Waste water treatment, Administrative decisions, Permits.

Plaintiffs, a concerned citizens group, affected land owners and a township, brought this action seeking review of a decision of the defendant Pennsylvania Department of Environmental Resources (DER) to grant a permit authorizing construction and operation of sanitary sewers and a sewage treatment plant. The permit was granted to Emerald Enterprises, Inc. The facilities were to serve an approved development. The Court noted its scope of review of DER decisions mandated that it affirm the DER decision unless appellant's constitutional rights were violated, there was an error of law, or there was insufficient evidence to support a finding of fact. Affirming the DER decision, the court made the following findings: (1) the state's Clean Streams Law mandating consideration of present and possible future use of waters does not prohibit changes in those uses; (2) an administrative review board fending that the stream and bog involved here were natural discharge areas rather than recharge area, with sufficient evidence, compiled with requirements of the Clean Streams Law; (3) there was no error in lack of consideration of potential flooding where the potential was purely speculative. SPEARS V. BERLE (WETLANDS PROPERTY USE RESTRICTIONS NOT A FAKING WHEN SERVING A PUBLIC PURPOSE).
407 N.Y.S. 2d 590-97 (App. Div. 1978).

Descriptors: *New York, *Wetlands, *Freshwater, *Permits, Legislation, Water law, Legal aspects, Condensation, Water permits, Land use, Environmental control.

Plaintiffs, owners of two parcels of land contaning freshwater wetlands, brought this proceeding seeking review of the denial of their application for a permit to remove humus, sand, and stone from the wetlands. New York's Fresh Water Wetlands Act (Act) requires that a permit be obtained from the Commission of Environmental Conservation in order to carry out virtually any activity on a freshwater wetland. A major question considered here by the Court was whether the use restrictions placed on plaintiffs' lands by the Act constitute a taking. After extensive discussion, the Court concluded that once it is demonstrated the property use restrictions serve some public purpose, the property owner must establish that the resulting hardship deprives him of any reasonable use of the property. Once this is established a 'de facto' taking will be determined to have occurred. If this test is met, the property owner may be entitled to compensation pursuant to the statute. However, the burden is on the property owner to show a hardship. In this case, the Court held that plaintiffs had not met this burden. (Stump-Florida)

THE LAW OF THE SEA CONFERENCE AT THE CROSSROADS,
United Nations, New York. Bulgarian Delegation.
A. Yankov.
Virginia Journal of International Law, Vol. 18, No. 1, p 31-41, Fall 1977.

Descriptors: *Law of the sea, *United Nations, *International law, *Negotiations, International waters, Jurisdiction, Oceans, Exploration, Exploitation, Continental shelf, Natural resources, Resource allocation.

The Third United Nations Conference on the Law of the Sea recently published the Informal Composite Negotiating Text. The upcoming Seventh Session may provide substantive compromise solutions to fundamental unresolved problems. There appear to be three common concerns among the delegations: (1) that the success of the Conference is of great importance; (2) that a compromise resolution of the outstanding issues is urgently needed; and (3) that the slow negotiations are being overtaken by unilateral action. The Conference is faced with the problem of reconciling opposing national claims and interests and harmonizing long-term perspectives on a global scale with considerations based on expediency and the geographical positions of individual states. The resolution of this dilemma requires an analytical and pragmatic approach in consideration of existing international realities. A general assessment of the work of the Conference leads to the conclusion that substantial progress in many areas has been made, but the concentrated negotiating effort needed to resolve the remaining issues should not be underestimated. Among the major unresolved issues, two categories are of critical importance: the regime of the international seabed and the status of the economic zone. (Quarles-Florida)

OCEAN AND COASTAL LAW TEACHING MATERIALS VOL. II - COASTAL LAW,
North Carolina State Univ. at Raleigh. Sea Grant Coll. Program.
T. J. Schoenbaum.
Sea Grant Publication UNC-SG-77-09, April, 1977, 363 p, $5.50. NOAA 04-6-158-44054.

Descriptors: *Coasts, *Water law, *Water poliby, *Legal review, Judicial decisions, Legal aspects, Legislation, Oceans, Law of the sea, Continental shelf, Law enforcement, Evaluation.

This compilation of diverse teaching materials examines the interrelationship between the law of the sea and legal problems associated with the coastal zone. Recognized is the fact that coastal planning decisions will affect how ocean resources are developed, and conversely, that development of ocean resources will impact upon the coastal zone. General topic areas included in this volume are public and private rights in coastal areas, and comprehensive coastal planning law. More specific areas covered include: (1) the public trust doctrine, which maintains that lands under navigable waters are held in trust by the government for use by the public; (2) shoreline changes; (3) public access to beaches; (4) conservation and development of public lands; (5) the regulatory and civil works activities of the U.S. Army Corps of Engineers, including consideration of the Federal Rivers and Harbors and Water Pollution Control Acts; (6) state regulatory activities; (7) the Federal Coastal Zone Management Act and similar state laws; (8) implementation of coastal planning; (9) and constitutional issues related to the coastal zone. These topics are covered through consideration of judicial decisions, statutes, and textual notes. (Malefatto-Florida)

ECONOMIC INCENTIVES FOR INSTITUTIONAL CHANGE: THE CASE OF THE VIRGINIA WETLANDS ACT,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agricultural Economies.
R. R. Carriker.
PhD Dissertation, November, 1976. 145 p.

Descriptors: *Wetlands, *Virginia, *Legislation, *Economic justification, Marshes, Land use, Economic feasibility, Economics, Decision making, Natural resources, Water demand, Marsh management, Market value.

The case of the Virginia Wetlands Act is presented as a problem setting within which to explore the view that protection of ecologically productive wetlands was associated with increases in demand for those goods, services, and activities dependent in some way on the ecological services of wetlands. A case study approach was used to examine the influence on residential land prices achieved by filling or draining saltmarshland. The market value of land is defined within the context of economic theory of rent. A land value comparison technique was used to identify market price differentials attributable to waterfront amenities of marshlands as residential sites. Changes in this differential over time are taken as a measure of the time rate of increase in social benefits attributed to development uses of marshes. Using estimates generated by other studies of parameters for the demand for sport fisheries, and time series observations on variables which influence demand for sport fishing in the Chesapeake Bay, estimates were made of the time rate of change in social benefits attributable to ecological productivity of undeveloped wetlands. Other sources of value for undisturbed wetlands were also noted. (Steiner-Mass)

COLORADO RIVER DEVELOPMENT, (COLORADO RIVER BASIN),
Upper Colorado River Commission, Salt Lake City, UT.
I. V. Goslin.
In: Values and Choices in the Development of the Colorado River Basin, ed. by D. F. Peterson and A. B. Crawford, p 18-60. University of Arizona Press, Tucson, 1978. 4 fig, 1 tab, 7 ref.

Descriptors: *Colorado River Basin, *Colorado River, *History, *Legislation, *Legal aspects, Regional analysis, River basins, Water law, Water management(Applied).

This outline of the history of the development of the Colorado River offers a broad look backward at the influences that had led to present conditions, as well as a base from which to analyze the consequencs and relative values of alternative choices relating to the future. Events covered include early exploration/navigation, early irrigated agriculture, modern irrigation (including the Salt River Project, Arizona; Strawberry Valley Project, Utah; and the Imperial Valley, California), the need for water storage reservoirs, and the 1922 Fall-Davis report. A detailed description of the evolution of the 'law of the river' follows, including the Colorado River Compact, the Boulder Canyon Project Act, the Mexican Water Treaty, the Upper Colorado River Basin Compact, the Colorado River Storage Project Act, the Fryingpan-Arkansas Project Act, the Colorado River Basin Project Act, the Water Resources Planning act, the National Water Commission Act, the National Environmental Policy Act, and the Federal Water Pollution Control Act, together with a summary of the myriad legal problems deriving from this incredibly complex historical sequence of legislation. He concludes with a brief discussion of new regional trends in which he reminds us that 'because there is no certain method of augmenting the limited water resources of the river system, future water development in the basin will depend upon sophisticated intensive management whose goal will be the best conservation and use of water for the greater economic and social values...' (See also W79-02732). (Paylore-Arizona).

POLITICS OF WATER ALLOCATION, (COLORADO RIVER BASIN),
Arizona Univ., Tucson.
H. Ingram.
In: Values and Choices in the Development of the Colorado River Basin, ed. by D. F. Peterson and A. B. Crawford, p 61-75. University of Arizona Press, 1978. 17 ref.

Descriptors: *Colorado River Basin, *Federal government, *Cost analysis, *River basins, Decision making, Political aspects, Evaluation, State governments.

This author maintains that Federal domination of decisions on water allocation has imposed costs upon the Colorado River Basin in terms of the quality of the decision making process and the reationality of water policy. Her arguments are based on consideration of costs to the Basin of Federal water development: e.g. limitations of choice imposed on regional equity and by Federal initiatives; the bias of choice introducted by Federal evaluation; information affected by Federal standards and limited by pressure toward unity as well as by pressure for early action; and finally lack of incentive for State planning and the inadequacies of Federal water policies pursued. She concludes by giving evidence of change within the Basin, particularly evidence that the grip which Federal water politics has had upon the Basin may be loosening, with the proportion of Federal investtment in western water development showing a decline. Nevertheless, account must be taken of the fact that much future planning is still taking place on the Federal level or within corporations based outside the Basin which Basin decision-makers find difficult to hold accountable. She makes a final plea to try again to achieve a Basin-wide setting of goals and objectives so that proposed resources projects can be evaluated in light of the kind of future the Colorado River Basin envisions for itself. (See also W79-02732). (Paylore-Arizona).

Descriptors: *Pueblo Indians Water Rights, *Water rights, Water utilization, Irrigation, Water allocation, Prior appropriation, Surface water, Groundwater, *New Mexico, *Rio Grande River(NM), Indian water rights, Indian reservations, *Winter's doctrine, Tesuque Pueblo(NM), Pojaque Drainage Basin(NM), Santa Fe County(NM).

This study concerns the water rights of the Pueblo Indians on the Upper Rio Grande using the Tesuque Pueblo as a case study. The Tesuque Pueflo is one of four Indian pueblos involved in a legal dispute over the water rights of the Pojaque Drainage Basin, located in Santa Fe County, New Mexico. A genral backround affecting this dispute is presented which includes the general legal status of Indian water rights in the United States at the present time and the past usage of water by the Pueblo Indians. The Tesuque Pueblo's case is disucssed with respect to this background, the possible allocation of water rights between the Tesuque Pueblo and their non-Indian neighbors, and the effect of utilizatin of these water rights on the immediate hydrologial system. WATER RESOURCES RESEARCH SUPPORT PROGRAM 1978-1979,
Department of Fisheries and Environment, Ottawa (Ontario). Inland Waters Directorate.
1978. 20 p., Text in English and French.

Descriptors: *Investigations, *Water resources, *Universities, Model studies, Econometrics, Social aspects, Water pollution control, Sediments, Hydrology, Subsurface waters, Contamination(Water), Snow, Ice, Permafrost, *Canada, *Alphabetical listing, *Institutional aspects, *Research.

The Department of the Environment, on the recommendation of the Water Resources Research Support Program Review Group, has agreed to provide a total of $1,000,000 for water-related environmental research during 1978 to 1979 to 24 Canadian universities. The Water Resources Research Support Program provides for innovative research relevant to Departmental concerns and responsibilities for water resources research in the natural and social sciences with emphasis on water management issues. By fostering the interest of university researchers, it thereby utilizes their knowledge and expertise in solving water research problems, and provides opportunities for their participation in socially relevant environmental research. The concerns and responsibilities of the Inland Waters Directorate include a comprehensive research program with which the Water Resources Research Support Program is integrated Some of the current priorities of this research agreement program with universities are: Economic, social and institutional aspects; water and sediment quality aspects; hydrologic modelling; subsurface contamination; hydraulics of water systems; snow and ice; resources data. M. J. Rettger.
Available from the National Technical Information Service, Springfield, VA 22161, as PB-291 341, Price codes: A11 in paper copy, A01 in microfiche. MS Thesis August 1977. 222 p, 18 fig, 38 tab. OWRT A-074-NY(1), 14-34-0001-7068.

Descriptors: *Flood damage, Programs, *Simulation analysis, *Cost analysis, Evaluation, Costs, Benefits, Mathematical models, Systems analysis, *Risks, Flood control, Model studies, *Alternative costs, *New York, Non-structural alternatives, Binghamton(NY), *Flood insurance programs.

An economic analysis of alternative flood relief programs is presented, based on the simulated flooding experience of the Binghamton (N.Y.) metropolitan area. The theory of consumer choice under conditions of uncertainty is used to develop evaluation criteria for flood insurance and disaster loan programs based on the benefits and costs of each program to both the public and the private sectors. A simulatin model is then designed to provide data for empirical implementation of the program analysis. The flood relief simulator is applied to a variety of possible assistance programs, including the national Flood Insurance program and the Small Business Administration disaster loan program. Model results suggest that program designs cause substantial variations in costs, not only in terms of total outlay, but also in the distribution of costs between the government and individuals. In general, the actuarial flood insurance program is a preferred choice based on total program costs. None of the programs studied have significant incentives on the relocation of flood-prone properties away from areas of high flood hazard.

6G. Ecologic Impact Of Water Development

ENVIRONMENTAL IMPACT ASSESSMENT.
Lyndon B. Johnson School of Public Affairs, Austin, TX.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 268. Price codes: A12 in paper copy, A01 in microfiche.

Descriptors: *Computer models, *Environmental engineering, *Planning, *Systems analysis, *Water resources development, Administrative agencies, Computers, City planning, Electric power, Environment, Environmental control, Federal government, Land use, Legal aspects, Mathematical models, Surveys, Waste disposal, Water law.

The ways in which environmental impact statements are prepared crucially depend upon the analysts' ideas of why the statement is being prepared, what purposes it is intended to serve, and what audiences it is intended to reach. One possible purpose of the impact statement is simply to comply with the letter of the law requiring that it be prepared. An impact statement complies if it includes the five points listed in the law: impacts of the action, unavoidable adverse effects, alternatives that had been considered and rejected, tradeoffs between long-term and short-term effects and irreversible commitments of resources. Other possible purposes of environmental impact statements are: to provide full disclosure of all significant effects of a proposed action on the quality of the human environment, to communicate information about environmental effects to audience outside the agency, and to improve the analysis and comparison of alternative proposals. Unfortunately, the statement itself has remained largely a legal document, whose content too often fails to contribute effectively to the process of selecting among alternative major actions. (Jordan-Florida)

ENVIRONMENTAL ASSESSMENT - ALTERNATIVES OF GENERAL MANAGEMENT PLAN AND WILDERNESS STUDY FOR CAPE LOOKOUT NATIONAL SEASHORE, NORTH CAROLINA.
National Park Service, Denver, CO. Denver Service Center.
Feb. 1978, 134 p., App.

Descriptors: *North Carolina, *Alternative planning, *National seashores, *Management, Legislation, Recreation, Public access, Parks, Environmental effects, Barrier islands, Freshwater, Comprehensive planning.

A general management plan is necessary for the preservation of North Carolina's Cape Lookout National seashore's natural values as well as to provide public access for the use and enjoyment of the area. A wilderness study is necessary to consider wilderness preservation of suitable areas along the seashore. This document attempts to analyze: critical resources and suggest alternatives visitor use and development strategies; and wilderness proposals for the area. From the various comments and components of the alternatives received during review of the document, a general management plan and a wilderness study will be formulated. As an initial step in developing a plan, a statement of management was prepared and made available for public review. The most frequently mentioned responses are listed. The legislative background concerning the area is explained. The legislative mandate, agreements, and regulations that guide planning for the area are set forth. Available resource information and ongoing studies relating to the area are explained. The area environment is described in detail. Five alternatives are set forth in detail, along with each alternative's projected impacts and adverse effects and mitigating measures. (Quaries-Florida)

ECOLOGICAL EFFECTS OF AN ARTIFICIAL ISLAND, RINCON ISLAND PUNTA GORDA, CALIFORNIA,
Dames and Moore, Los Angeles, CA.
G. F. Johnson, and L. A. deWit.
Army Coastal Engineering Research Center Miscellaneous Report No. MR-78-3, September 1978. 108 p, 21 fig, 4 tab, 20 ref, 7 append. DACW 72-76-C-0011.

Descriptors: *Ecology, *Offshore platforms, *Environmental effects, *Water quality, Resources development, Biota, Water resources, California, Oil wells, *Outer Continental Shelf, *Artificial Islands, Ecological effects.

Marine ecological conditions at Rincon Island, located approximately 0.8 kilometer offshore between Ventura and Santa Barbara, California, in a depth of 14 meters are documented. The island, which was constructed between 1957 and 1958 to serve as a permanent platform for oil and gas production, is particularly suitable for ecological study. Habitat features associated with the armor rock and concrete tetrapods surrounding the island support a 'microecosystem' which differs in biotic composition from surrounding natural bottom areas. A major part of the study is devoted to analysis of seasonal dynamics in biotic composition. Data analysis indicates that many species exhibit significant variability in abundance from one season to the next. Other studies include a gill net survey of fish fauna, mapping of mussel 'talus' beds at the base of the island, and a survey of biota along a natural bottom transect between the island and shore. In general, the findings indicate a rich and varied fauna and flora associated with the high-relief solid substrate of Rincon Island which differs substantially from the more depauperate natural bottom habitats in the area. THE EFFECT OF HYPOLIMNION RESERVOIR RELEASES ON FISH DISTRIBUTION AND SPECIES DIVERSITY,
Texas Univ. at Austin. Dept. of Zoology.
R. J. Edwards.
Transactions of the American Fisheries Society, Vol. 107, No. 1, p. 71-77, 1978.

Descriptors: *Dams, *Fish populations, Fish physiology, Cold resistance, Hypolimnion, *Reservoirs, *Thermal stratification, Trophic level, Productivity, Impounded water, Impoundments, Sunfishes, Catfishes, Biological communities, Ecosystems, Species diversity.

The fish faunas above and below Canyon Reservoir, Comal County, Texas, were surveyed to determine the effect of the impoundment upon the downstream community. Although 22 species were found above the reservoir, only 18 species were taken in the area downstream from the dam. Comparisons with pre-impoundment surveys of this area, taken a quarter century ago, indicate that seven species, which were once present in the downstream area, are now absent. Species diversity indices demonstrate reduced diversity below the impoundment. Changes in downstream water quality, especially water temperature, due to hypolimnion water releases, seem to be the most likely causal factors associated with this disruption of the natural stream community. Descriptors: Forecasting, *Risks, *Evaluation, Reliability evaluation, Systems approach, Colorado River, Salinity Project, *Environmental Impact Statement.

An environmental impact statement (EIS) is meant to be a predictor of the consequences of actions on the environment. However, uncertainties in the statements make it difficult to determine the reliability of the predictions and thus the consequences of the actions. Hence, use of an EIS could be counter-productive if the inherent uncertainties are not recognized and considered in its evaluation. Examination of several EIS's from a systems viewpoint is used to expose the following sources of uncertainty: (1) the identification of the components of the system, (2) the natural uncertainty of the inputs to the system and of the transformation functions producing the output, (3) uncertainties in the modeling of the system due to limitations of sample, economic and technological data. The above viewpoint is used to analyze the Colorado River Salinity Control Project EIS. Uncertainties are identified and classified and means for assessing and incorporating their effect on the environmental impact assessment are discussed.

REMOTE SENSING OF SURFACE SOIL MOISTURE,
National Aeronautics and Space Administration, Greenbelt, MD. Goddard Space Flight Center
T. Schmugge.
Journal of Applied Meteorology, Vol. 17, No. 10, p 1549-1557. October 1978. 10 fig, 16 ref.

Descriptors: *Remote sensing, *Soil moisture, *Soil surfaces, Temperature, Thermal radiation, Radar, Microwaves, Diurnal distribution, Evaporation, Soil types, Drying, Aircraft, Correlation analysis, Dielectric properties, Skylab.

The unique thermal and dielectric properties of water afford two possibilities for remotely sensing the moisture content in the surface layer of the soil. Observations of the diurnal range of surface temperature, the microwave brightness temperature (emissivity) and radar backscatter of the soil have shown correlations of up to 0.9 with the moisture in the surface layer (approximately 5 cm thick). The microwave techniques appear to maintain their sensitivity to moisture variations in the presence of a crop canopy. Observations of microwave brightness temperature from satellite platforms have qualitatively confirmed this sensitivity for a wide range of conditions. (Visocky-ISWS)

SATELLITE OBSERVATIONS OF CALCIUM CARBONATE PRECIPITATIONS IN THE GREAT LAKES,
National Environmental Satellite Service, Washington, DC.
A. E. Strong, and B. J. Eadie
Limnology and Oceanography, Vol. 23, No. 5, p 877-887, September 1978. 9 fig, 3 tab, 17 ref

Descriptors: *Remote sensing, *Calcium carbonate, *Great Lakes, Satellites(Artificial), Chemical precipitation, Chemicals, Circulation, Water circulation, Lakes, On-site data collections, Sampling, Data processing, Photography, Limnology, *Whitings.

Reflectance patterns apparently from calcium carbonate ($CaCO_3$) precipitation have been mapped in the Great Lakes using satellite multispectral imagery. The milky water phenomenon ('whiting') occurred regularly in summer and fall during the period studied, 1972-1975, in Lakes Ontario, Erie, and Michigan, but not in Superior and Huron. In situ data provide nearly irrefutable evidence that these whitings are calcareous. They are attributed to supersaturation of $CaCO_3$ during periods of thermal stratification and are most intense in the warmer areas of the lakes. The whitings are maximal several meters below the surface and are undoubtly significant with respect to light transmission, affecting the euphotic zone and thereby photosynthetic production. The whitings may serve as lakewide markers in synoptic analysis of large-scale epilimnial horizontal motions. (Sims-ISWS)

V. C. Carter.
In: Proceedings of the Symposium on Technical, Environmental, Socioeconomic, and Regulatory Aspects of Coastal Zone Management, American Society of Coastal Engineers, San Francisco, p 1261-1283, March 14-16, 1978. 1 fig, 1 tab, 59 ref.

Descriptors: *Wetlands, *Mapping, *Remote sensing, Census, Surveys, Coastal marshes, Aerial photography, Marsh management.

An overview is presented of the applications of remotely-sensed data to coastal wetlands. In part, technical problems are related to definition and classification; scale, formats, and boundaries, evaluations, mapping methodology, and overlapping responsibility of agencies. Today's operational inventories in coastal states are built on the past decade of research and technology development in remote sensing of wetlands. These inventories and map products utilize aerial photographs as a basic data source and differ in scale, format, minimum mapping unit, classification system, and purpose. The Fish and Wildlife Service is conducting a new national inventory of wetlands which is intended to provide a standardized basis for comparison of wetlands. It too will use available aerial photographs as a basic data source. In the future, satellite data may provide an accurate, reliable, and economical source to update wetland inventories and to monitor or evaluate coastal wetlands. The improvement in technology accompanying the development and launch of LANDSAT C and D and the Space Shuttle promise to make satellite digital data a more powerful tool to supply future management weeds for coastal wetlands. (Steiner-Mass)

APPLICATIONS OF REMOTELY SENSED DATA TO WETLAND STUDIES,
Geological Survey, Reston, VA.
V. Carter.
COSPAR: Space Research Volume XVII. Rycroft, J. J., and Strickland, A. C. (eds.), p 19-23, 1977. 11 ref.

Descriptors: *Wetlands, *Remote sensing, *Mapping, Marsh plants, Aerial photography, Censuses, Satellites, Salt marshes, Fresh water marshes, Distribution patterns.

Remotely sensed data from both aircraft and satellite platforms have been used for a variety of wetland studies. For example, identification of major vegetative associations with LANDSAT digital data made it possible to estimate primary productivity in a Virginia salt marsh. Both seasonal color infrared photographs and LANDSAT digital data are being used for inland wetland investigations. In co-operation with the Tennessee Valley Authority, wetlands in western Tennessee are being classified and mapped at 1:24,000 scale using color infrared photographs which show both boundary dynamics an vegetation. The U.S. Geological Survey and the U.S. Fish and Wildlife Service are using color infrared photographs to aid in a hydrologic study and to map vegetation at 1:24,000 and 1:100,000 scales in the Great Dismal Swamp of Virginia and North Carolina. In each case the base maps are being used to evaluate the accuracy of LANDSAT analyses with the objective of using LANDSAT data for monitoring vegetative change and for updating maps. (Steiner-Mass)

A NEW METHOD FOR COLLECTING WATER SAMPLES FROM BENEATH THE ICE,
Queen's Univ., Kingston (Ontario). Dept. of Geological Sciences.
R. J. Patterson, L. Dykes, S. Frape, R. A. McLeod, and J. Wickens.
Limnology and Oceanography, Vol. 23, No. 5, p 1029, September 1978. 3 ref.

Descriptors: *Sampling, *Water sampling, *Lakes, *Ice, Equipment, Methodology, On-site investigations, Data collections, Limnology, Samplers, Subice water samplers.

A subice sampler was made of a length of tubing which can be tightly sealed at one end by means of a clamp. It was placed open end down through a hole in the ice, pressurized and sealed to maintain the water level below the ice base so that water inside will not freeze, and allowed to freeze in place. Water samples from beneath the ice were collected by releasing the pressure in the tube and withdrawing water with a small hand-operated pump. (Sims-ISWS)

DEW-MONITORING NETWORK IN THE SOUTHEAST,
National Weather Service, Auburn, AL. Environmental Studies Service Center.
R. R. Getz.
Bulletin of the American Meteorological Society, Vol. 59, No. 9, p 1150-1154, September 1978. 4 fig, 1 tab, 6 ref.

Descriptors: *Dew, *Monitoring, *Alabama, *Georgia, *Florida, *Southeast U.S., Foods, Fibers(Plant), Plant diseases, Diseases, Climatology, Insects, *Dew-monitoring network, Crop harvesting, Duvdevani dew gage, Davis-Hughes wetting system.

A network for monitoring dew in the humid climate of southeasten United States was described. Dew is an important factor in the production of food and fiber and plays a role in the development and spread of many plant diseases, in the activity of insects, and in the application of pesticides. The harvest of major crops in Alabama, Georgia, and Florida, such as peanuts, cotton, and citrus, also are affected by dew. Data were collected from the network each day for use in agricultural weather advisories. Later analysis of the data as recorded on strip charts provided additional detailed information. The design of the instrument system allows for an excellent response to a range of wetness intensities. Nearly all the network stations used a standard bush for the sensor exposure, with the sensors deployed in a similar manner in and near the bush. All dew data were summarized by month and season. UN NOUVEL ASPIRATEUR SOUS-MARINS A AIR COMPRIME (A NEW SUBMARINE SUCTION-SAMPLER, USING COMPRESSED AIR),
Centre d'Oceanographie, Marseille (France). Station Marine d'Endoume.
C. C. Emig.
Marine Biology, Vol. 43, p 379-380, 1977. 1 fig, 2 ref. (In French with English abstract).

Descriptors: *Research and development, *Sampling, *Design, *Research equipment, Technology, Benthos, Instrumentation, Testing, Equipment, Construction equipment, Methodology, Annual populations.

An automatic submarine auction apparatus for qualitative benthos sampling was described. The sampler was described as being easy to handle. Suction was affected by means of compressed air from cuba diving bottles and was regulated from the surface. Water inlets in the form of 5 small tubes were used to counterbalance the suction effect. 15 kg of lead was used as ballast for the sampler. (EIS-Klein)

INEXPENSIVE CONSTANT WATER LEVEL DEVICE FOR FLOW-THROUGH AQUARIUMS,
Mississippi State Univ., Mississippi State. Dept. of Biochemistry.
D. L. Garling, Jr., and R. P. Wilson.
The Progressive Fish-Culturist, Vol. 38, No. 1, p 52-53, 1976, 2 fig.

Descriptors: *Design, *Laboratory tests, Research and development, Design criteria, Evaluation, Specifications, Design data, Aquaria, Laboratory equipment, Bioassay, Aquiculture, *Methodology, *Constant water level device, *Flow-through aquaria.

An inexpensive device for maintaining constant water levels in flow-through aquariums, designed and built for use in fish laboratories, was described. The constant-level device consisted of a siphon that emptied water into a reservoir which had a side arm near the top for final water removal to the appropriate drain. The dimensions, materials, and costs of construction were given. (Katz).

ANALYSIS OF GRAVITY DATA FROM THE PICACHO BASIN, PINAL COUNTY, ARIZONA,
Arizna Univ., Tucson. Dept. of Geosciences.
F. J. Christie.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 139, Price codes: A09 in paper copy, A01 in microfiche. M.S. Thesis, 1978. 105 p, 35 fig, 2 tab, 67 ref. OWRT A-073-ARIZ(1), 14-34-0001-8003.

Descriptors: Groundwate, Geophysics, Subsidence, Data collections, Data analysis, *Gravity surveys, Model studies, *Arizna, Picaho Basin area(Ariz).

A gravity survey was conducted in the Picacho Basin area, located approximately midway between Phoenix and Tucson, Arizona, to define the bedrock surface configuration. Regional gravity effects were removed from the gravity data using a double Fourier series trend surface technique, and the gravity data were modelby using a two-dimensional iterative program. Analysis of both the complete Bouguer and residual gravity anomaly maps indicates that the Picacho Basin is a north-south trending graben-like structure with significant pediment development beneath as much as 2000 feet of alluvium. The maximum basin depth is nearly 15,600 feet. A thick (as much as 6000 feet) and extensive body of massive anhydrite lies situated between buried basin faults scarps that sometimes are in excess of 10,000 feet in vertical extent. Modeling also reveals an apparent strong correlation between modeled buried bedrock surface irregularities (generaly recognized as scarps and ridges) and the location of earth fissures near the basin periphery. Of the peripheral earth fissures crossed by profiles lines, 83% could be correlated within + or - 1/2 mile to a modeled bedrock surface irregularity.

SELECTED HYDROLOGIC DATA, 1931-77, WASATCH PLATEAU-BOOK CLIFFS COAL-FIELDS AREA, UTAH,
Geological Survey, Salt Lake City, UT. Water Resources Div.
K. M. Waddell, H. L. Vickers, and P. K. Contratto.
Open-file report 78-121, 1978. 33 p, 2 fig, 1 plate, 14 tab, 4 ref.

Descriptors: *Water quality, Effects, *Coal mines, *Surface waters, *Groundwater, Data collections, Streamflow, Discharge(Water), Springs, Water wells, Water levels, Drillers logs, Water analysis, Chemical analysis, Streambeds, Utah, *Wasatch Plateau-Book Cliffs coal-fields area.

The Wasatch Plateau-Book Cliffs coal-fields area in east-central Utah includes a significant part of the State's coal resources and is currently (1977) the most active coalmining area in the State. Data gathered by the U.S. Geological Survey are presented as part of a hydrologic reconnaissance in cooperation with the U.S. Bureau of Land Management during the period July 1975-September 1977 as well as selected data for the period 1931-75. Also included are selected data collected by private, State, and other Federal agencies. Types of data include water-level records, logs of selected wells, discharge of springs, wells, and mines, gaged and estimated streamflow, chemical analyses of water from springs, wells, mines, and streams, and laboratory analyses of streambed material and formation samples. The report is intended to make data available to those assessing the water resources that may be affected by coal-mining activities in the Wasatch Plateau-Book Cliffs coal-field are. (Woodard-USGS)

HYDROLOGIC DATA FOR URBAN STORM RUNOFF FROM THREE LOCALITIES IN THE DENVER METROPOLITAN AREA, COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
S. R. Ellis.
Available from OFSS, Branch of Distribution, USGS, Box 25425, Fed. Ctr. Denver, CO 80225, microfiche $4.50 pc $28. Open-file report 78-410, May 1978. 135 p, 4 fig, 3 plates, 59 tab, 6 ref.

Descriptors: *Urban runoff, *Storm runoff, *Water quality, *Path of pollutants, *Watershed management, Hydrologic data, Rainfall-runoff relationships, Snowmelt, Water analysis, Chemical analysis, Dissolved solids, Trace elements, Nutrients, Biochemical oxygen demand, Coliforms, Pesticides, *Colorado, *Denver area(Colo).

Urban storm-runoff data, collected from 1975 to 1977, on three catchment areas in the Denver, Colo., metropolitan area are presented. The catchment are predominantly a single-family residential catchment area in Littleton, a multifamily residential and commercial catchment area in Lakewood, and a high-density residential and commercial catchment area in Denver. Precipitation, rainfall-runoff, snowmelt-runoff, water-quality (common constituents, nutrients, biochemical oxygen demand, coliform bacteria, and solids, trace elements, and pesticides), and catchment-area data are necessary to use the U.S. Environmental Protection Agency's Storm Water Management Model II. The urban storm-runoff data may be used by planning, water-management, and environmental-protection agencies to assess the impact of urban storm runoff on the hydrologic system. (Woodard-USGS)

WATER RESOURCES DATA FOR OKLAHOMA, WATER YEAR 1977--VOLUME 2. RED RIVER BASIN.
Geological Survey, Oklahoma City, OK. Water Resources Div.
Water-Data Report OK-77-2, September 1978. 235 p, 8 fig.

Descriptors: *Oklahoma, *Hydrologic data, *Surface waters, *Groundwate, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Red River basin.

Water resources data for the 1977 water year for Oklahoma consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes or reservoirs. Volumes 1 and 2 of this report contain discharge records for 112 gaging stations; stage and contents for 22 lakes or reservoirs; water quality for 95 gaging stations, 3 lakes, and 8 wells; and water levels for 49 wells. Also included are 41 crest-stage partial-record stations and 1 low-flow partial-record station. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. These data represent that part of the national Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Oklahoma. This report (volume 2) includes the Red River basin. (Woodard-USGS)

WATER RESOURCES DATA FOR ARKANSAS, WATER YEAR 1977.
Geological Survey, Little Rock, AR. Water Resources Div.
Water-Data Report AR-77-1, August 1978. 650 p, 5 fig, 3 tab.

Descriptors: *Arkansas, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water-resources data for the 1977 water year for Arkansas consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of wells. This report contains discharge records for 70 gaging stations; stage only records for 1 gaging station; stage and contents for 13 lakes and reservoirs; water quality for 136 stations, 69 partial-record flow stations, and 7 lakes; and water levels for 82 observation wells. Also included are 119 crest-stage partial-record stations. Additional water data were collected at various sites, not part of the systematic data collection program and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Arkansas. (Woodard-USGS)

WHAT THE DESIGN ENGINEER NEEDS FROM THE HYDROMETEOROLOGIST,
CH2M Hill, San Francisco, CA.
W. P. Henry, and J. J. Cassidy.
Journal of Applied Meteorology, Vol. 17, No. 10, p 1558-1563, October 1978. 9 ref.

Descriptors: *Design data, *Hydrologic data, *Meteorological data, Data processing, Analytical techniques, Construction, Hydraulic structures, Projects, Engineering, Design storm, Scheduling, Planning, Safety, Data, Weather data, Rainfall, Runoff, Water yield, Dams, Structures, Civil engineering, Meteorology, Hydrology, *Data requirements.

The water resources engineer is faced with three major types of problems when designing projects: (1) determination of project yield, (2) determination of project safety, and (3) determination of project scheduling. Hydrometeorology plays an important role in solving each type of problem. The most urgent needs the design engineer has for the expertise of the hydrometeorologist were identified and described. In addition, publications regularly read by design engineers were listed so that the hydrometeorologist can effectively communicate his information to the practicing engineer. (Sims-ISWS)

APPLICATION OF COMPUTER WAVEFORM MATCHING TO MONITORING OF HYDROLOGIC SYSTEM PARAMETERS,
Nebraska Univ., Lincoln.
P. Chao-Hsing.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 432, Price codes: A06 in paper copy, A01 in microfiche. Ph.D Dissertation, July 1977. 110 p, 20 fig, 16 tab, 37 ref. OWRT B-031-NEB(1), 14-31-0001-5088.

Descriptors: Computers, *Optimization, *Streamflow simulators, *Modeling studies, *Simulation analysis, Monitoring, Mapping, Algorithms, Watershed models, *Waveform matching method.

A new waveform mapping approach to optimization of parameters in a streamflow simulator based on a distributed hydrologic system model has been designed, described and applied. Assuming initial values, the model parameters for the simulator are adjusted using information obtained from waveform-mapped comparisons of observed and predicted hydrographs. Optimization of the simulation parameters is performed by a two-dimensional transformation and regression technique which yields values of mapping parameters that provide the feedback information used for adjusting the model parameters. The algorithm has been tested both independently and in conjunction with watershed streamflow simulators. The results of these tests indicate the success of the original waveform matching method designed for parameter optimization in streamflow simulators.

CHARACTERISTICS AND FILTERING OF NOISE IN LINEAR HYDROLOGICAL SYSTEMS,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
J. W. Delleur, and R. A. Rao.
In: Proceedings of Warsaw Symposium-Mathematical Models in Hydrology, July 1971, IAHS-AISH Publ. No. 101, p 570-579, 1974. 5 fig, 15 ref. OWRT-B-022-IND(5).

Descriptors: *Hydrologic systems, *Rainfall, *Runoff, Rainfall-runoff relationships, Fourier analysis, *Linear systems, Computational noise, *Digitization noise, Transfer functions, Filtered data.

The identification and fitting of a linear model of the short-range rainfall-runoff transformation are affected by the presence of noise generated by the computational procedure and by errors in the data. The digitization and computational noise is analysed by means of the Fourier amplitude spectra of the input and of the output. The effect of this noise may be reduced by judicious choice of the digitization step and of the truncation limits of the integrations in the transform domain. The rainfall data are usually more contaminated by noise due to error than the runoff data. The noise attributed to the rainfall data is estimated and its probability distribution and spectrum are then obtained. The error noise may be controlled by digital filtering. The effectiveness of the filters is shown by comparing the rainfall noise spectra obtained from filtered and unfiltered data.

SUSPENDED SEDIMENT AND BED MATERIAL STUDIES ON THE LOWER MISSISSIPPI RIVER,
Army Engineer District, Vicksburg, MS. Potamology Section.
L. G. Robbins.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A044 285, Price codes: A10 in paper copy, A01 in microfiche. Report 300-1, August 1977. 227 p, 69 fig, 17 tab, 20 ref, 6 plate, 12 photo, 5 append.

Descriptors: *Potamology, *Mississippi River, *Sediments, *Data collections, Suspended solids, River beds, River basins, On-site data collections, Rivers, Alluvial channels, Sediment yield, Sediment discharge, Sampling, Particle size, Bed load samples, Discharge(Water), Suspended load, Flow characteristics, Roughness(Hydraulic), Roughness coefficient.

The ultimate purpose of sediment studies in the Army Engineer District, Vicksburg, is to develop a workable knowledge of the basic principles controlling the transport of sediment in the Lower Mississippi River and to apply this knowledge toward effective and economical stabilization works for flood control and navigation. The more immediate purpose of this report, however, was to present the data that have been collected and analyzed to date (1929-1974) and to show what trends exist in the quantities and sizes of suspended and bed sediments for the Vicksburg District. For this report, measurements of all available bed-material samples were presented, but presentation of suspended sediment measurements was limited to data collected at the 3 main discharge ranges since data at these ranges have been collected at regular.

frequent intervals. Some analysis of the data was made, but no theoretical aspects of sediment transport were presented. The information presented in the tables and graphs of this report may be considered as a step toward the realization of the ultimate purpose of sediment studies in the Lower Mississippi River. (Humphreys-ISWS)

HYDRAULICS AND DYNAMICS OF NEW CORPUS CHRISTI PASS, TEXAS: A CASE HISTORY, 1972-73,
Texas Univ. at Austin, Port Aransas. Marine Science Inst.
E. W. Behrens, R. L. Watson, and C. Mason.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A038 472, Price codes: A07 in paper copy, A01 in microfiche. Army Coastal Engineering Research Center, Fort Belvoir, VA. GITI Report 8, Jan 1977. 126 p, 74 fig, 10 tab, 46 ref, 5 append. DACW72-72-C-0026, DACW72-72 C-0027.

Descriptors: *Inlets(Waterways), *Sediment transport, *Tidal waters, *Texas, *Gulf of Mexico, Beaches, Sediments, Sands, Tides, Waves(Water), Ocean waves, Sedimentation, Erosion, Hydraulics, *Corpus Christi Pass(Texas), Tidal inlets, Tidal currents.

In 1972, a 2-mile channel was dredged through Mustang Island, Texas, to increase water exchange and fish migration between Corpus Christi Bay and the Gulf of Mexico. The pass' initial adjustment to tides, waves, and other forces was measured the first year following the opening. Hydraulic and sedimentary effects of the pass were studied by obtaining detailed bathymetric, topographic, and hydraulic surveys of the pass and adjacent gulf beaches; daily wave observations provided information on the seasonal variability in wave height, period, and direction. An estimated 1 million cubic yards of sand accumulated at the pass during construction of two gulf jetties. Thereafter, a loss of sand greater than the estimated net annual longshore transport rate occurred on beaches south (downdrift) of the jetties. Considerable sediment was deposited on shoals at the bay end of the pass with little accumulation in the pass. Hydraulic measurements indicated that channel frictional resistance increased by about 50% over the study period; although greater variability occurred during individual tidal cycles. Tidal discharges through the pass was highly dependent upon variations in the gulf tides, with equal volumes of ebb and flood flows during diurnal tides and strong flood predominance during mixed and semidiurnal cycles. The average discharge through the pass was only about 3% of the total tidal prism of Corpus Christs Bay, indicating that the bay tides, which partly control flow through the pass, result primarily from passage of the tide through Aransas Pass, the major bay-gulf connection. The pass was marginally stable during the first year, but the wide range of climatic conditions in the region probably will cause the pass to be stable in some years and unstable in others. Although the pass undoubtedly influences bay water within the immediate vicinity, no significant effect on flushing of Corpus Christi Bay resulted from the pass construction. (Sims-ISWS)

CAPACITY STUDIES OF WINFIELD LOCKS, KANAWHA RIVER, WEST VIRGINIA,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Hydraulics Lab.
L. L. Daggett, and R. W. McCarley.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A037 382, Price codes: A06 in paper copy, A01 in microfiche. Miscellaneous Paper H-77-1, February 1977. 95 p, 16 fig, 17 tab, 2 ref, 5 append.

Descriptors: *Locks, *Navigation, *Inland waterways, *West Virginia, Rivers, Barges, Hydraulic structures, Model studies, Mathematical models, Simulation analysis, Evaluation, *Kanawha River(WV), River traffic, Facility capacity.

The Winfield lockage facilities, located near Winfield, West Virginia, currently consist of two 360-ft x 56-ft chambers with a normal lift of 28 ft. With the increasing traffic on the Kanawha River, these facilities Are no longer adequate to serve the towing industry using this portion of the inland waterway system. Excessive delays now occur at Winfield, and if the predicted traffic growth materializes during the next 10 or 15 years without action being taken to address the problem, transfers of traffic movements to other more costly modes of transportation will result. Accordingly, studies were conducted to determine the capacity of the existing lockage facilities and to evaluate possible solutions for increasing this capacity through the use of alternative operating policies and rules that have been beneficial at other lock sites. Using two simulation models, four alternative operating policies were simulated to determine their respective effects on the capacity of the Winfield locks and the delays to be expected should such policies be possible. THE OXFORD UNIVERSITY WATER CAVITATION TUNNEL. DESCRIPTION AND OPERATING PROCEDURES,
Oxford Univ. (England). Dept. of Engineering Science.
A. B. Bailey.
Report No. 1083/74, 1974. 26 p, 9 fig.

Descriptors: *Cavitation, *Tunnel hydraulics, *Research facilities, Research facilities, Research equipment, Instrumentation, Equipment, Laboratory equipment, Tunnel pressure, Laboratory tests, Pumps, Flow, Hydraulics, Water circulation, Tunnels, Cavitation tunnels.

The Oxford University water cavitation tunnel, like all tunnels for cavitation studies, comprises a closed hydraulic circuit with means for both circulating the water at pre-selected speeds past the test body and for controlling the mean ambient pressure around the body. This provides control over both the Reynolds number and the tendency to cavitate (cavitation number). The tunnel is unusual in that a diffuser for energy recovery is not fitted downstream of the test section; this arises due to its original configuration as a free jet tunnel. While the absence of a diffuser renders the tunnel relatively uneconomical in running power consumption, the tunnel does have the advantage of removing any restriction on the choice of test section configuration. DEVELOPMENT OF CAVITY TYPE TUBEWELLS,
Indian Inst. of Tech., Kharagpur.
B. Anjaneyulu, A. C. Pandya, and A. P. Mishra.
In: International Symposium on Development of Ground Water Resources, November 26-29, 1973, Madras, India, Vol. 2, p III-87-III-94, 2 fig, 1 tab, 6 ref.

Descriptors: *Artesian aquifers, *Wells, Groundwater, Drilling, Inflow, Application methods, Drill holes, *Tube wells, *Cavity wells, Confined aquifers.

Cavity wells are a special type of tubewells constructed in confined aquifers. The well boring is carried to the surface of the water bearing stratum and some small amount of sand is taken out with a sand boiler, crating an initial cavity. This cavity is further enlarged by pumping water at a high rate. The movement of the sand particles begins only when the drawdown is equal to the critical drawdown. This value is dependent on the properties of the aquifer material, such as mass and cohesiveness, and the radius of the initial cavity. It is, however, independent of the aquifer thickness. The mathematical development of these forces is presented. (Bradbeer-NWWA)

Translated from Soviet-American Working Seminar 'Technology of Construction of Structures under Cold-Climate Conditions', Moscow (USSR), p 16-28, May 1977.

Descriptors: *Earth dams, *Cold weather construction, *Permafrost, *Dam construction, Dams, Cold regions, Frozen soils, Thawing, Stability, Foreign research, Temperature, Dam foundations, Structures, Hydraulic structures, Engineering, Civil engineering, *USSR.

Thawed dams, which allow thawing of frozen soils in the foundation during operation, can be built, provided the deformations in the foundation due to thawing and thermal settling do not result in a loss of the stability of the structure. Development and implementation of a set of measures will make it possible to build dams out of binding soils in the Far North at temperatures down to -40 to -45C and to eliminate completely the seasonal nature of construction work. The dumping of excess water during construction over the crest of an uncompleted dam will make it possible to reduce the cost of building expensive temporary water diversion structures. (Sims-ISWS)

CRREL Draft Translation 658, November 1977. 14 p, 4 fig. Translated from Proceedings of the Soviet-American Working Seminar 'Technology of Construction of Structures Under Cold Conditions,' held May 25-26, 1977 at Leningrad (USSR). 14 p.

Descriptors: *Earth dams, *Rockfill dams, *Permafrost, *Cold weather construction, Model studies, Mathematical models, On-site investigations, Dams, Cold regions, Temperature, Measurement, Heat transfer, Freezing, Thawing, Civil engineering, *USSR.

The earth-rock dam predominates under Far North conditions because it is the most efficient and economical type of dam for handling medium and high heads. Hydraulic engineering construction practice has required scientific mastery of many problems which have arisen in designing earth-fill, high-head dams in the northern construction climate zone of the USSR. One question, whose solution is of primary importance for the development of economically efficient construction of earth dams and the technology for their exploitation, involves predicting and controlling the thermal regime of earth-rock dams during construction and operation. This report described methods developed to calculate the thermal regime of earth dams, along with data from field observations of such structures. (Sims-ISWS)

FUNDAMENTALS OF CONSTRUCTING FROZEN TYPE EARTH DAMS IN THE ARCTIC,
All-Union Designing, Surveying and Scientific Research Inst. Hydroproject, Moscow (USSR).
G. F. Biianov, G. F. Maslovskiy, and L. N. Toropov.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A045 130, Price codes: A02 in paper copy, A01 in microfiche. CRREL Translation 651, October 1977. 14 p, 6 fig, 2 ref. May 1977. 16 p.

Descriptors: *Earth dams, *Cold weather construction, *Permafrost, *Frozen soils, Freezing, Soils, Dams, Spillways, Structures, Hydraulic structures, Construction, Cold regions, Ice, Heat transfer, Engineering, Civil engineering, *USSR, *Frozen type dams.

Available experience makes it possible to determine the main trends for improving the designs, methods, and techniques of erecting frozen and thawed dams from soil materials and also makes it possible to make some conclusions: (1) Frozen-type dams may be erected on weak, ice-saturated, frozen soils if dependable, frozen, antifiltration screens in the body of the dam are provided and are joined with the frozen soils of the base. (2) The design of the dam may be different, depending on the organization of work to erect the dam and to create the frozen screen. If the freezing system is installed prior to the beginning of constructing the dam and the frozen screen is created simultaneously with erection of the dam, the tuckstone of the argillaceous core may be eliminated as a structural member. (3) When work in erecting dams is organized with simultaneous installation of the frozen screen, it is possible to use local frozen water or clay mortars. The core of these dams may be erected by building up or pouring soil into the water. (4) The use of water-soluble heat carriers (brines) is not permitted to freeze the soils of the dam core since they thin the frozen soil in case of leaks. (Sims-ISWS)

EVALUATION OF STABILITY OF EARTH-FILL DAM BASED ON STRENGTH OF FROZEN ZONES OF ITS PROFILE,
G. I. Kuznetsov.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 255, Price codes: A02 in paper copy, A01 in microfiche. CRREL Draft Translation 628 July 1977. 6 p, 2 fig. Translated from Russian.

Descriptors: *Dams, *Earth dams, *Permafrost, *Cold weather construction, Freezing, Thawing, Cold regions, Soils, Frozen soils, Soil properties, Soil physical properties, Soil physics, Reservoirs, Stress, Hydrostatic pressure, Infiltration, Soil water movement.

When planning a permafrost dam, it is necessary to consider that the freezing of its lower wedge due to natural cooling of the surface of the lower slopes and the transfer of cold from the permafrost curtain may take 3 to 4 years if the soil is not allowed to freeze layer by layer during the filling process. This report discussed the strength and stability of earth filled dams based on durability of frozen zones of its profile. (Sims-ISWS)

STUDIES OF NONSTATIONARY TEMPERATURE REGIME OF FROZEN DAMS MADE OF LOCAL MATERIALS ON PERMAFROST FOUNDATIONS.
N. V. Ukhova.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A047 601, Price codes: A02 in paper copy, A01 in microfiche. CRREL Draft Translation 665, November 1977. 22 p, 1 fig, 4 ref. Translated from the author's abstract of a dissertation in defense of the degree of candidate in technical sciences, 1967. 18 p.

Descriptors: *Dams, *Permafrost, *Ice, *Temperature, Thermal properties, Rockfill dams, Earth dams, Thawing, Freezing, Structures, Hydraulic structures, Construction, Cold regions, Cold weather construction, *USSR, Frozen dams.

The specific characteristics of hydraulic engineering construction on permafrost foundations under harsh climatic conditions result in a situation in which the most economic type of dam in the regions is the type made of local materials. A distinction can be made between two methods of constructing dams from local materials on permafrost foundations: the 'warm' method, used when construction takes place primarily during the summertime by usual methods, and usually encountered in regions with moderate climates; and 'cold,' when construction takes place in winter with stratified freezing of the entire dam or its individual elements, or in summer, with subsequent freezing of the structure. The frozen part of the dam is intended to make it impermeable to water. Reliable operation of partly or completely frozen dams is determined by the temperature regime of the construction and the foundation, which must be such that the frozen 'curtain' in the dam does not thaw out during the latter's operation. The dissertation was devoted to an analytical experimental study of the nonstationary temperature regime of frozen dams made of local materials on permafrost foundations, and reported on one aspect of the problem of construction of dams on permafrost foundations. INVESTIGATION OF SLUMPING FAILURE IN AN EARTH DAM ABUTMENT AT KOTZEBUE, ALASKA,
Cold Regions Research and Engineering Lab., Fairbanks, AK. Alaskan Projects Office.
C. M. Collins, and T. T. McFadden.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A042 306, Price codes: A03 in paper copy, A01 in microfiche. Special Report 77-21, July 1977. 25 p, 26 fig, 1 tab, 5 ref, 2 append. Pub. Health Serv. 243-76-0206.

Descriptors: *Earth dams, *Dam failure, *Permafrost, *Cold weather construction, *Alaska, On-site investigations, Thawing, Freezing, Dams, Drill holes, Drillers logs, Thermal properties, Measurements, Slope stability, Slope stabilization, Cold regions, Civil engineering, *Kotzebue(Alaska), Slumping failure.

A slumping failure on the upstream side in one area of the water supply reservoir at Kotzebue, Alaska, was investigated. Seven 80-ft (24.4-m) thermocouple strings were emplaced in the dam abutment, and an additional four thermocouple strings were installed behind the dam, extending to a depth of 95 ft (28.9 m) below the bottom of the reservoir. All thermocouples indicated below freezing temperatures at their respective positions. These measurements combined with the drill logs indicated that neither the dam nor the abutment is in immediate danger of failure, but that steps must be taken to stop the sloughing of material in the abutment area. Recommendations were given to accomplish this. (Sims-ISWS)

ANALYTICAL COMPUTATION OF THE THREE-DIMENSIONAL STEADY-STATE TEMPERATURE CONDITION OF A DAM,
P. A. Bogoslovskiy.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A037 655, Price codes: A02 in paper copy, A01 in microfiche. CRREL Draft Translation 601, Feb 1977. 9 p, 2 fig, 6 ref. p 24-30, 1970.

Descriptors: *Earth dams, *Permafrost, *Temperature, *Model studies, Mathematical models, Heat transfer, Frozen soils, Freezing, Thawing, Reservoirs, Dams, Cold regions, Cold weather construction, Structures, Hydraulic structures, Analytical techniques, Engineering, Civil engineering, *USSR.

Temperature conditions are of very great significance for earth darns based on permafrost ground. One of the indices of the temperature condition of nonfiltering earth dams on a permafrost base is the steady-state (temporally invariable) temperature distribution for mean annual conditions, that is, for the mean water level in the reservoir, and the mean temperature readings at ground level. Tasks such as these were reviewed for two-dimensional conditions on the assumption of a very broad river valley compared with the cross sectional dimensions of the dam. But consideration also must be given to three-dimensional conditions, where dams abut the sides of valleys, for example, in order to evaluate the cooling influence of the sides of a valley, and other factors, in order to solve engineering problems. These questions ordinarily are elucidated by electrothermal analogy testing of models. These factors are the reason for seeking an analytical solution to the three-dimensional problems of the steady-state temperature field. (Sims-ISWS)

CENTRIFUGE MODELLING STUDIES ASSOCIATED WITH DESIGN AND CONSTRUCTION OF EARTH DAMS,
All-Union Designing, Surveying and Scientific Research Inst. Hydroproject, Moscow (USSR).
V. I. Shcherbina.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A045 129, Price codes: A02 in paper copy, A01 in microfiche. CRREL Draft Translation 650, October 1977. 17 p, 7 fig, 7 ref. Moscow (USSR), May 1977. 18 p.

Many problems that arise during construction and design of earth hydroengineering complexes, such as estimating the bearing capacity of an inhomogeneous base, determining the lateral pressure of the soil, determining the criterion of crack formation in the cores of dams, estimating the stability of the slopes of structures, cannot be resolved confidently when conducting ordinary model experiments with full-scale soils. The main reason for this is that the stresses due to the natural weight in the models are considerably less than those in real structures: at the same time, as shown previously, the deformation and strength properties of soils under small and large stresses may differ considerably, and not only quantitatively but qualitatively as well. To overcome this difficulty permits the use of the centrifuge modelling method in investigations, the main advantage of which is the possibility of investigating relatively small models made of full-scale soil under stresses similar to full-scale in absolute value and by the nature of distribution. This report went into detail concerning this modelling technique. (Sims-ISWS)

SILT SAMPLING STUDY, BONNEVILLE SPILLWAY DAM, BONNEVILLE, OREGON.
Army Engineer Div. North Pacific, Bonneville, OR.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A000 304, Price codes: A02 in paper copy, A01 in microfiche. Report No. 14-1, January 15, 1944. 20 p, 4 fig, 1 tab.

Descriptors: *Suspended solids, *Columbia River, *Bonneville Dam, Sediments, Silts, Quartz, Calcite, Diatoms, Clays, Sampling, Analysis techniques, Data processing, Seasonal, Erosion, Dams, Spillways.

The purpose of the study was to determine, over a period of one year (1 April 1942 to 31 March 1943), the amount and character of the suspended material carried by the Columbia River at Bonneville Spillway Dam. The results of the study were: (1) The amount of suspended material carried by the Columbia River varied from a maximum of 638 p.p.m. to a minimum of 10 p.p.m. during the year of sampling; the average for the period was 76 p.p.m. (2) Petrographic and x-ray examinations of the suspended material showed the presence of varying amounts of quartz, calcite, diatoms, volcanic ash, clay minerals, and feldspar; quartz being the only one occurring in hard angular grains. (3) The fineness analyses of the silt indicated a fairly uniform size distribution for the year of sampling. (Sims-ISWS)

DAM OF THE ANADYRSK THERMAL ELECTRIC POWER STATION,
A. L. Kuznetsov.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A047 359, Price codes: A02 in paper copy, A01 in microfiche. CRREL Draft Translation 659, November 1977. 18 p, 6 fig, Translated from Trudy Gidroproyekta, No. 34, p 83-100, 1973.

Descriptors: *Earth dams, *Cold weather construction, *Permafrost, *Dam construction, Cold regions, Dams, Construction, Design, Dam design, Soils, Frozen soils, Structures, Hydraulic structures, Weather, Foreign countries, Foreign research, Temperature, Engineering, Civil engineering, *USSR.

In 1964, a dam was constructed to supply water to the city of Anadyr' on the Chukotka Peninsula. The dam is 8.5 m high and 410 m long, and it impounds a reservoir with a volume of about 1 million cu m. It is planned to increase the reservoir capacity nearly seven-fold to meet the increasing requirements of the city and the thermal electric power station under construction. A dam 16 m high (24 m including the toe) and a crest 1,500 m long will be required. The existing dam will be incorporated as the upper wedge of the new dam. The dam will be constructed in a permafrost area with severe climate and harsh engineering and geological conditions. This will be one of the largest dams built on friable permafrost sediment which settles after the soil thaws. The installation will include a dam, self-regulating spillway, and a stilling basin with pump. (Sims-ISWS)

DAM DESIGN AND CONSTRUCTION IN THE USSR'S NORTH AND SIBERIA,
All-Union Designing, Surveying and Scientific Research Inst., Hydroproject, Leningrad (USSR).
L. K. Domansky, L. I. Kudoyarov, and V. G. Radchenko.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-044 747, Price codes: A02 in paper copy, A01 in microfiche. CRREL Draft Translation 646, September 1977. 14 p, 9 fig, 10 ref. Translated from Soviet-American Working Seminar Technology of Cooperative Construction in Extreme North Climates, Leningrad (USSR), May 1977.

Descriptors: *Cold weather construction, *Dams, *Earth dams, *Dam design, Concrete dams, Cold regions, Frozen soils, Permafrost, Freezing, Thawing, Temperature, Structures, Hydraulic structures, Construction, Engineering, Civil engineering, *USSR, *Siberia(USSR).

On the basis of major experimental work and with the use of modern methods of calculating temperature regimes in dams, scientifically justified methods of planning hydrotechnical installations have been worked out for the Far North; basic principles have been established for the design of both earth and concrete dams; and engineering procedures have been introduced that make it possible to work year-round on dam construction. The construction of many dams with various heads has yieldeda great deal of experience and proved the possibility of successfully erecting dams under the most severe conditions in the Far North of the USSR. PREDICTING PERFORMANCE OF PIPE CULVERTS BURIED IN SOIL.
Purdue Univ., Lafayette, IN. Engineering Experiment Station.
G. A. Leonards, and M. B. Roy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-265 638, Price codes: A11 in paper copy, A01 in microfiche. Report No. FHWA-JHRP-76-15, May 1976. 235 p, 46 fig, 7 tab, 95 ref, 5 append. C-36-32F, HPR-1(12) Pt II.

Descriptors: *Culverts, *Pipes, *Structural design, *Underground structures, Analytical techniques, Finite element analysis, Numerical analysis, Computer programs, Loads(Forces), Mathematics, Soils, Soil properties, Anisotropy, Construction materials, Stress analysis, Strain.

An analytical tool based on the finite element method was developed to analyze buried culvert problems in a realistic fashion. Segments of a curved bar with three degrees of freedom (normal, tangential, and rotational) at each end were used to simulate a thin pipe where nodal moments are important. Triangular, isoparametric elements with one curved boundary (to fit the shape of pipe), and three midside nodes were used to represent the soil. A special type of 'interaction' element with zero thickness was used between pipe and soil to simulate interface behavior, including slip and/or the inability to resist tensile stresses. Nonlinear, anisotropic soil properties were accounted for. Actual test data were used as input for soil properties. A computer program was written to include all the aspects mentioned above, and example problems were solved to demonstrate its versatility and to investigate the influence of such factors as non-linear soil properties, relative stiffness of pipe and soil, inclusion of weak materials near the spring line, and construction procedures. The present program is applicable only for analysis of two-dimensional problems transverse to the pipe in which the state of stress either in the soil mass or in the pipe does not approach failure. (Humphreys-ISWS)

ANALYSIS OF CONSOLIDATION OF EARTH AND ROCKFILL DAMS, VOLUME I, MAIN TEXT AND APPENDICES A AND B,
California Univ., Berkeley, Coll. of Engineering.
C. S. Chang, and J. M. Duncan.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A045 332, Price codes: A07 in paper copy, A01 in microfiche. Contract report S-77-4, Volume I, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, September 1977. 143 p, 52 fig, 3 tab, 71 ref, 2 append. DACW39-74-C-0027.

Descriptors: *Earth dams, *Soils, *Consolidation, *Model studies, Mathematical models, Clays, Saturated soils, Rockfill dams, Instrumentation, Dams, Finite element analysis, Soil water, Soil water movement, Permeability, Compressibility, Stress, Flow, Theoretical analysis, Soil science.

This study was undertaken to develop the theory for analyzing the consolidation of partly saturated clay soils, and subsequently to develop a practical procedure for performing finite analyses of the behavior of dams during construction, during reservoir filling, and during the development of long-term seepage. The theory developed couples the effects of both stress and flow and takes account of the varying permeability and compressibility of the pore fluid and the nonlinear stress-strain behavior of the soil. A number of elastic-plastic, stress-strain relationships were reviewed with respect to their capabilities for modeling the stress-strain behavior

of compacted clays. The results of this study indicated that the behavior of the dam during consolidation is closely related to the stiffness and degree of saturation of the core. The finite element procedure developed is a potentially useful tool. It seems likely that its greatest value in application will be in connection with interpretation of instrumentation studies for zoned earth and rockfill dams. (Sims-ISWS)

Army Engineer Waterways Experiment Station, Vicksburg, MS.
R. L. Stowe.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A029 827, Price codes: A03 in paper copy, A01 in microfiche. Miscellaneous Paper C-71-4, May 1971. 47 p, 32 fig, 2 tab.

Descriptors: *Deformation, *Borehole geophysics, *Rock mechanics, *Rock properties, On-site investigations, Rocks, Shales, Limestones, Strength, Loads(Forces), On-site tests, Foundations, Rock foundations, Locks, Dams, Civil engineering, Geology, *Cannelton Lock and Dam(Ohio River), plate bearing tests.

An NX-size, borehole, plate-bearing device known as a Goodman jack was used to perform 31 load deformation tests in the foundation rock, Pier No. 3, at Cannelton Lock and Dam. The in situ modulus of deformation was calculated using the load deformation data. These data were examined to evaluate the quality of the foundation rock; the foundation rock consists of Menard formation limestone, Waltersburg shale, Vienna limestone, and Tor Springs sandstone. The test results indicated that the top 35 ft of Waltersburg shale near the upstream side of Pier No. 3 is about twice as competent as the shale near the downstream side. The average moduli of deformation are 18,620 and 38,650 psi for the upstream and downstream sides, respectively. Moduli for the limestones and the sandstone are above 100,000 psi. The load deformation curves exhibit accelerated displacement at load levels above 500 psi. This displacement is due to either shear failure of the shale, sliding along pre-existing planes of weakness, or a combination of both. (Sims-ISWS)

EFFECT OF SUBZERO TEMPERATURE IN CONCRETE ON THE NATURE OF OPERATIONS OF HIGH CONCRETE DAMS,
V. N. Durcheva.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A027 016, Price codes: A02 in paper copy, A01 in microfiche. CRREL Draft Translation 531, July 1976. 8 p, 3 fig. Translated from Gidrotekhinicheskoe Stroitel'stvo, No. 3, p 26-29, March 1973.

Descriptors: *Dams, *Reservoir operations, *Cold regions, Concrete, Concrete structures, Concrete dams, Temperature, Freezing, Cold weather construction, Stress, Construction joints, Expansion joints, Thermal expansion, Loads(Forces), Engineering, Civil Engineering, *USSR.

Comprehensive, large-scale studies of the dams of the Bratsk and Krasnoyarsk hydroelectric stations have provided a wide range of experimental material on the operation of high dams under severe climatic conditions and, in particular, have revealed the role of temperature as the most important factor causing deformation and stress in dams. The calculation of temperature stresses which arise in dams during construction and during operation does not take into consideration the changes in the physical and mechanical properties of frozen concrete. This is hindered by the lack of qualitative relations which define the effect of subzero temperature on the principal characteristics of monolithic hydroengineering concrete. Experimental and full-scale studies of the properties of frozen concrete have made it possible to recommend empirical relationships for determining the linear expansion coefficient as a function of the subzero temperature of concrete and its strength. (Sims-ISWS)

CONCRETE PLACING TECHNIQUES USED DURING THE CONSTRUCTION OF THE KRASNOIARSK HYDROELECTRIC POWER PLANT,
Ye. A. Dolginin.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A026 967, Price codes: A02 in paper copy, A01 in microfiche. CRREL Draft Translation 534, July 1976. 13 p, 3 fig, 4 tab. Translated from No. 9, p 19-23, September 1972.

Descriptors: *Concrete dams, *Dam construction, *Cold weather construction, Winter, Construction, Dams, Powerplants, Hydroelectric power, Concrete, Concrete structures, Freezing, Stress, Strength, Temperature, Engineering, Civil engineering, *USSR, Construction techniques.

The concrete Krasnoyarsk hydroelectric station dam, 124 m high, is approximately 1,100 m long and is located in a relatively narrow rocky canyon of the Yenesey River. The amount of concrete in the dam and hydroelectric station building is 5.5 million cu m. The concrete operations were accomplished under severe climatic conditions--the frost-free period was 102 days long and temperatures ranged from -54 to 37C. Great requirements were levied on the concrete with regard to strength, imperviousness to water, cavitation resistance, cold resistance, and fracturing resistance. This report discussed the construction problems and considerations. (Sims-ISWS)

COEFFICIENT OF LINEAR EXPANSION OF MASSIVE CONCRETE AT A NEGATIVE TEMPERATURE,
S. Ya. Eydel'man, and V. N. Durcheva.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A028 067, Price codes: A02 in paper copy, A01 in microfiche. CRREL Draft Translation 537, July 1976. 19 p, 9 fig, 3 tab, 6 ref. Vol. 84, p 158-170, 1967.

Descriptors: *Concrete, *Thermal expansion, *Concrete dams, *Cold regions, Freezing, Thawing, Dams, Stress, Expansion, Deformation, Construction joints, Expansion joints, Temperature, Cold weather construction, On-site investigations, Laboratory tests, Concrete testing, Engineering, Civil engineering, *USSR.

The article presented the results of full-scale extensometric measurements of free thermal deformations of concrete in 41 sections of the Bratsk hydroelectric station dam at a negative temperature. It was shown that the coefficient of linear expansion of frozen concrete is 1.6 times greater, on the average, than at a positive temperature, and that there is a relationship between these coefficients and the strength of the concrete. Melting of the concrete is accompanied by the appearance of residual deformation of elongation. Tests specially conducted on samples 10 x 10 x 40 cm in size of different composition of the concrete yielded similar results. Data were provided on the effect of a change in the value of the coefficient of linear expansion of the frozen concrete on openings of construction joints and cracks as well as the stress state of the concrete. CONSTRUCTING CONCRETE DAMS IN REGIONS WITH SUBZERO AVERAGE YEARLY TEMPERATURE,
K. A. Mal'tsov, Sh. N. Plyam, and L. I. Kudoyarov.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A030 936, Price codes: A02 in paper copy, A01 in microfiche. CRREL Draft Translation 549, October 1976. 9 p, 5 fig, 10 ref. Translated from Izvestiya Vsesoyuznogo Nauchno-Issledovatel'skogo Instituta Gidrotekhiki, Vol. 101, p 133-138, 1973.

Descriptors: *Concrete structures, *Concrete dams, *Cold weather construction, *Cold regions, Dams, Construction, Temperature, Freezing, Permafrost, Thermal expansion, Strength, Mechanical properties, Structures, Hydraulic structures, Concrete, Expansion, Deformationl Engineering, Civil engineering, *USSR.

Building concrete hydraulic engineering structures in regions with severe climatic conditions characterized by a sub-zero average yearly temperature raises a number of problems which do not occur when dams are construted in regions with a moderate or warm climate. These problems arise because of the complete freezing of a considerable amount of the embankment of a concrete dam during the operational period on the one hand, and the change in the thermomechanical properties of the concrete (coefficient of linear expansion, strength, modulus of elasticity, etc.), on the other hand. This report addressed those problems. (Sims-ISWS)

POTENTIAL ALKALI-CARBONATE ROCK REACTIVITY OF SOME OF THE AGGREGATE USED IN FISHTRAP DAM,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Concrete Lab.
A. D. Buck.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A025 761, Price codes: A03 in paper copy, A01 in microfiche. Miscellaneous Paper C-76-3, June 1976. 24 p, 4 fig, 6 tab, 8 ref.

Descriptors: *Aggregates, *Alkali-aggregate reactions, *Laboratory tests, *Concrete testing, Concrete, Dams, Spillways, Concrete dams, Carbonate rocks, Chemical reactions, Alkalis(Bases), Petrography, Cores, Coarse aggregates, Analytical techniques, Civil engineering, *Fishtrap Dam(Ky).

Two samples of carbonate rock coarse aggregate were obtained from the quarry that furnished some of the coarse aggregate for Fishtrap Dam, located near Pikeville, Kentucky. These materials were subjected to petrographic examination. Small rock cores were prepared from some of these aggregate

particles and were tested for length change in sodium hydroxide solutions. Five concrete mixtures were made in the laboratory using these aggregates; specimens from these mixtures were made in the laboratory using these aggregates; specimens from these mixtures were tested for length change durng moist storage or during storage in laboratory air followed by moist storage; other specimens were tested for compressive strength. Six concrete cores from the spillway portion of Fishtrap Dam were received in the laboratory. They were inspected and photographed. Thin sections were made, and selected specimens were tested for length change during moist storage. It was concluded that an alkali-carbonate rock reaction had occurred at Fishtrap Dam. There was no indication that this was a deleterious reaction. It is likely that the use of low-alkali portland cement and relatively small aggregate size served to keep the reaction at a safe level. It is also possible that natural dilution of the reactive rock by innocuous rock had a moderating effect on the reaction. (Sims-ISWS)

ENGINEERIN CONDITION SURVEY AND STRUCTURAL INVESTIGATION OF EMSWORTH LOCKS AND DAM, OHIO RIVER,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Concrete Lab.
C. E. Pace.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A029 844, Price codes: A08 in paper copy, A01 in microfiche. Miscellaneous Paper C-76-8, August 1976. 153 p, 52 fig, 2 tab, 3 ref, 1 append.

Descriptors: *Locks, *Dams, *Ohio River, *Structural analysis, *Structural stability, Structures, Concrete, Concrete structures, Concrete dams, Concrete testing, Surveys, Stress, Strength, Cracks, Weathering, Evaluation, Engineering, Civil engineering, *Emsworth Locks and Dam(Ohio River).

The Concrete Laboratory at the Army Engineer Waterways Experiment Station was contracted to prepare an engineering condition survey and structural investigation for Locks and Dam 3, Monongahela River, and Emsworth and Montgomery Locks and Dams, Ohio River. This report gave the results of an engineering condition survey and a structural analysis of Emsworth Locks and Dam, Ohio River. In general, the monoliths on the land wall do not meet present day criteria for overturning, sliding, or base pressures. Also, some monoliths in the middle and river walls do not meet present day stability requirements. In fact, the stability analysis of M-22 along with the visual observation of a 1-1/2 inch separation between the ceiling of the emptying culverts and the middle wall indicated that there has been some movement of these middle wall monoliths. The main concern for concrete interity is the cracked, spalled, and deteriorated surface concrete which will allow accelerated deterioration, reducing the effective section of the monoliths and increasing the already excessive tensile stresses. In general, if corrective measures are not taken, this will surely cause maintenance expense and also will reduce the life of the concrete monoliths. The compressive stresses are larger than indicated by the stress analysis and also can cause problems in deteriorated concrete. From the deteriorated condition of the surface of the lock monoliths, it is evident that some action must be initiated. Since corrective action is needed, a feasibility study should be made to determine what action is necessary which will provide the most economical and adequate lock usage over a period of 30 to 50 years. (Sims-ISWS)
W79-02706

CONDITION SURVEY OF LOCK AND DAM 3, OHIO RIVER,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Concrete Lab.
B. J. Houston
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A029 817, Price codes: A04 in paper copy, A01 in microfiche. Miscellaneous Paper C-74-7, May 1974. 61 p, 28 fig, 3 tab, 6 ref, 5 append.

Descriptors: *Locks, *Dams, *Ohio River, *Structural analysis, Structural stability, Structures, Concrete, Concrete structures, Concrete dams, Concrete testing, Surveys, Borehole cameras, Photography, Stress, Cracks, Weathering, Evaluation, Engineering, Civil engineering, *Lock and Dam 53(Ohio River).

A condition survey of Lock and Dam 53, which is located on the Ohio River between Paducah, Kentucky, and Cairo, Illinois, was authorized and funded by the Army Engineer District, Louisville, in April 1973. Lock and Dam 53 was constructed approximately 45 years ago, and the purpose of this investigation was to determine the general condition of the structure in order that effective plans could be made to accomodate present and future river traffic. The Army Engineer Waterways Experiment Station was requested to conduct a part of the investigation, including a crack survey, borehole camera studies in drilled holes, and sonic studies of the structure. The Ohio River Division Laboratory (ORDL) conducted physical tests and a petrographic examination of drilled concrete cores. Results of ORDL's tests were included in this report. The results of the investigations indicated that the concrete in the underwater sills, the piers, and the fixed weir is dense, homogeneous concrete free from damage from cement-aggregate reaction, from sulfate attack, and from serious frost damage. Cracking of the concrete was extensive, but not excessive, and apparently can be attributed to physical causes such as freeze-thaw cycles of the exposed concrete, normal shrinkage, and minor foundation problems. Excessive cracking was found only in pier 2. The cracking in pier 2, however, is not considered to be structurally damaging. (Sims-ISWS)
W79-02711

NONMETALLIC WATERSTOPS,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
G. C. Hoff, and B. J. Houston.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A030 955, Price codes: A03 in paper copy, A01 in microfiche. Miscellaneous Paper C-70-22, October 1970. 31 p, 7 fig, 3 tab, 16 ref.

Descriptors: *Concrete structures, *Waterproofing, *Watertight, *Sealants, Laboratory tests, Onsite investigations, Weathering, Tensile strength, Physical propeties, Materials, Materials testing, Construction joints, Expansion joints, Concrete, Civil engineering, *Waterstops, *Nonmetallic waterstops.

Nonmetallic waterstops having suitable properties for use in joints in hydraulic structures of concrete have been made successfully from natural rubber, synthetic rubber, and polyvinyl chloride. To perform satisfactorily, a waterstop must have sufficient strength and extensibility to avoid being ruptured by joint movement, and it must maintain strength and extensibility over the temperature range and in spite of chemical attack from the environment of service. The waterstop also must have suitable dimensions and configuration and be installed so as to avoid waterflow around the embedded ends. Field and laboratory studies led to the conclusion that suitable waterstop materials should have a tensile strength of at least 1,400 psi (plastic), 2,000 psi (rubber), the ability to elongate 280% (plastic) or 360% (rubber), and to have various levels of maintenance of relevant properties after various chemical and thermal exposures. (Sims-ISWS)

LABORATORY TESTS OF CONCRETE AGGREGATE AND RIPRAP FOR NEW LOCK AND DAM NO. 26,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Concrete Lab
W. O. Tynes, and C. R. Hallford.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A029 838, Price codes: A06 in paper copy, A01 in microfiche. Miscellaneous Paper C-72-4, March 1972. 113 p, 16 fig, 11 tab.

Descriptors: *Aggregates, *Mississippi River, *Riprap, *Rocks, *Concrete, Dams, Locks, Laboratory tests, Testing, Coarse aggregates, Limestones, Carbonate rocks, Construction materials, Strength, Chemical reactions, Structures, Hydraulic structures, Concrete technology, Engineering, Civil engineering, *Lock and Dam No. 26(Mississippi River).

Ledge rock from 3 commercial sources was tested for suitability for use as riprap, and material from 1 of the sources of ledge rock as well as crushed aggregate also were tested for use as concrete coarse aggregate. Drilled 6-inch-diameter cores from 2 commercial sources were tested for suitability for use as riprap and concrete coarse aggregate A coarse sand and a blending sand were tested for use as concrete fine aggregate. Crushed aggregate manufactured from each of the 2 cores and 1 of the ledge rocks was tested in combination with blends of the coarse and fine sand for freezing and thawing of concrete aggregate. Results of the petrographic examination and tests on 5 sources of carbonate rock for riprap were reported. Consideration of the results of the freezing-and-thawing tests conducted according to CRD-C 144 on 3 sources of carbonate rock for use in concrete indicated similarity. However, it appears that the material from 1 company is preferable to the others because it is thicker bedded. Material from a nearby quarry was used previously in the Alton Lock and Dam, and it is known to be a reactive carbonate rock. Reaction rims have been observed in the Alton concrete. Considerations of field behavior of the Alton concrete and laboratory testing for length change of the Alton concrete showed that this is not an expansive reaction and no precautionary measures are required for its use. Evaluation of rock from the Columbia Quarry and the Riverview Quarry for potential reactivity indicated that that Columbia rock was not reactive. However, some of the ledge 3 Riverview rock is potentially reactive. (See also W77-10978) (Sims-ISWS)

SPRAY GROUTING: SUMMARY OF RESEARCH, DEVELOPMENT, UTILIZATION, AND FUTURE USES,
Minnesota Univ., Minneapolis, Dept. of Civil and Mining Engineering.
C. R. Nelson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-252 340, Price codes: A02 in paper copy, A01 in microfiche. Report NSF-RA-T-75-073, December 8, 1975, 5 p. NSF GI-37862X.

Descriptors: *Grouting, *Cement grouting, *Tunneling, *Sandstones, Rocks, Tunnels, Stability, Strength, Tunnel linings, Rock bolts, Tunnel construction, Spraying, Sodium compounds, Civil engineering, *Spray grouting

A spray grouting technique was developed for hardening a 1 to 6 inch surface layer of weak sandstones, such as the St. Peter Sandstone in Minnesota. When used on tunnel walls and roofs, the technique provides temporary excavation support in larger tunnels and a permanent lining in smaller utility tunnels. This eliminates or reduces the need for more costly conventional support The research and deveopment has cost about $100,000 in RANN funds, and $50,000 of industry user funds. The technique is being used now in an 8,000 foot long storm water tunnel and in a 6,500 foot long utility tunnel. The estimated savings from the use of the new method is $1,300,000 on these two projects. Increased use of the method is expected. (Sims-ISWS)

DESIGNING CONCRETE DAMS FOR ESPECIALLY HARSH CLIMATIC CONDITIONS,
All-Union Designing, Surveying and Scientific Research Inst., Hydroproject, Leningrad (USSR)

V. I. Teleshev, and S. A. Frid.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A047 592, Price codes: A02 in paper copy, A01 in microfiche. CRREL Draft Translation 657, November 1977. 20 p, 4 fig, 8 ref. Translated from a collection of articles from the Gidroproyekt Institute imeni S. Ya. Zhuk, Leningrad (USSR), p 32-46.

Descriptors: *Dams, *Cold weather construction, *Dam design, *Concrete dams, Cold regions, Powerplants, Design, Planning, Dam construction, Dam foundations, Temperature, Freezing, Concrete, Foreign research, Construction, Structures, Hydraulic structures, Engineering, Civil engineering, *USSR.

During the last 20 years, extensive hydraulic engineering construction projects have advanced far into the depths of regions of the USSR with harsh and very harsh climates. Exploitation of the very rich energy resources of the rivers in the central and eastern parts of Siberia, the coastal regions, and the Far North has posed a number of complex problems which had not been encountered before by designers and builders of hyraulic engineering projects. This report discussed the principal aspects of designing concrete dams on rock foundations in regions with especially harsh climates. (Sims-ISWS)

EVALUATION OF LINER MATERIALS EXPOSED TO LEACHATE,
Matrecon, Inc., Oakland, CA.
H. E. Haxo, Jr., and R. M. White.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 913, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-76-255, September 1976. 63 p, 3 fig, 22 tab, 5 ref, 1 append. EPA 68-03-2134.

Descriptors: *Linings, *Materials, *Leachate, *Laboratory tests, Materials testing, Evaluation, Landfills, Membranes, Impervious membranes, Asphalt, Plastics, Polymers, Soil cement, Soil asphalt, Rubber, Water pollution, Water pollution control, Liner materials.

This report presented available information covering the first year's exposure to liner materials to sanitary landfill leachate. Included in the report were descriptions of the monitoring and dissassembly of the generators to recover the liner specimens, the results of the testing of the exposed liners, and a discussion of the results. The year's exposure did not result in losses of impermeability in any of the liners. There were some losses, however, in the compressive strength of the admix liner materials. There were some losses in the physical properties of some of the polymeric membranes and swelling of most of these membranes. The seams of several lost strength, the crystalline types of polyethylene, polypropylene, and polybutylene sustained the least change during the year's exposure. However, these liners, or films, are prone to puncture and tear and are generally difficult to handle in the field. The thermoplastic membranes, chlorinated polyethylene, chlorosulfonated polyethylene (Hypalon), and polyvinyl chloride, tended to swell the most. The vulcanized rubbery liner materials, e.g., butyl and EPDM, changed little during the exposure period but had the lowest initial seem strength. The data presented must be considered as preliminary in an ongoing project; it is premature at this point to make estimates of the service life of the various materials or to make relative comparisons among them for use in a given installation without consideration to costs and to the specifics of the installation. CONDITION SURVEY-ASBESTOS-BONDED STEEL CULVERTS IN WESTERN OREGON,
Federal Highway Administration, Portland, OR. Region 10.
S. Deocampo, T. Gruber, and B. Wasill.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 377, Price codes: A06 in paper copy, A01 in microfiche. Report No. FHWA-OR-76-1, 1976. 109 p, 1 fig, 1 tab, 9 ref. 10-2.

Descriptors: *On-site investigations, *Culverts, *Linings, *Corrosion, *Oregon, Surveys, Roads, Highways, Pipes, Construction materials, Corrosion control, Abrasion, Coasts, Brackish water, Metal pipes, Hydraulic structures, Deterioration, Steel, Aluminum, Coatings, Bituminous material, Asbestos-bonded coating, Corrugated metal.

A field investigation of 33 highway culvert installations was made in December 1975 and January 1976 to evaluate the service life of corrugated metal culverts on coastal highways, with emphasis on the durability of the asbestos-bonded protective treatment in marine and brackish water. Metal culverts also were studied. The survey was limited to visual examination and qualitative appraisal of the conditions noted, primarily to document performance to date and to collect data for future study and monitoring. No attempt was made to quantify metal loss. The report included the individual inspection records and some photos. (Humphreys-ISWS)

REVIEW AND ANALYSIS OF BLASTING AND VIBRATIONS AT BANKHEAD LOCK,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Soils and Pavements Lab.
R. J. Lutton.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A026 735, Price codes: A05 in paper copy, A01 in microfiche. Technical Report S-76-6, June 1976. 81 p, 30 fig, 11 tab, 8 ref.

Descriptors: *Excavation, *Alabama, *Rock excavation, *Vibrations, Canal construction, Locks, Channels, Explosives, Rocks, Geology, Hazards, Data processing, Engineering, Civil engineering, *Bankhead Lock(AL).

The Army Corps of Engineers recently replaced the old Bankhead Lock on the Black Warrior River, Alabama, with a larger lock. The new lock required an approach canal excavated by the removal of more than 5 million cu yd of rock. Preliminary test shots and an exploratory excavation contract of 0.35 million cu yd established blasting and monitoring techniques that assured that vibration and settlement of the old lock would not be excessive. Shots were monitored with particle velocity pickups on and adjacent to the lock. A relationship between peak particle velocity and scaled distance was checked on the basis of these data after normalization for structure behavior, coupling, and transmissivity. Recommendations from the test shot program were used in specifications for the exploratory excavation contract. The exploratory excavation, with about 50 presplit and production shots, served as a second testing program for refining the previous observations and conclusions, according to various blasthole arrays and time delays. A principal product of this work was a refined criterion for no-damage to be used in the main excavation contract. The experience gained in preliminary work allowed for more realistic and lower unit-price bids on the main contract. During the main contract, involving the excavation of 5 million cu yd of rock, about 1,000 shots were fired on 9 working levels. Analyses of data generated on this project revealed the effects of 3 factors: delay, confinement, and, to a lesser degree, explosive type. A log normal distribution of peak particle velocities was indicated by analy-

ses of data from large groups of presplit and production shots. The distribution model is proposed for use in predicting ground vibrations at specific scaled distances. (Sims-ISWS)

EFFECTS OF REDUCED NIGHTTIME FLOW ON UPSTREAM MIGRATION OF ADULT CHINOOK SALMON AND STEELHEAD TROUT IN THE LOWER SNAKE RIVER,
Idaho Univ., Moscow. Water Resources Research Inst.
K. M. McMaster, R. G. White, R. R. Ringe, and T. C. Bjornn.
Completion Report, Contribution No. 93, Idaho Forest, Wildlife and Range Experiment Station, July 1977. 64 p, 19 fig, 10 tab, ref, 3 append. Army, Corps of Engineers, DACW8-76-C-0016.

Descriptors: *Instream flow, *Fish migration, *Chinook salmon, *Steelhead trout, Powerplants, *Idaho, *Fish passages, Lower Snake River(Ida), Lower Monumental Dam(Ida), Little Goose Dam(Ida).

During 1975 and 1976, an assessment was made of the effects of reduced nighttime flows on the upstream migration of adult chinook salmon and steelhead trout. During the summer and fall, reducing discharge from the dams to zero at night (2300-0700 hours) had no observable effect on migration of adult fish. During the first phase of the study (July-October 1975), radio telemetry was used and mark-recapture techniques to evaluate chinook and steelhead movement patterns and travel rates during the periods of uncontrolled and reduced nighttime flows. Nighttime flows were provided for 8 hours each night on a 7-day rotating schedule of 0 and 10,000 cfs. No differences were observed in behavior or rates of travel of radio- or magnetic-tagged chinook or steelhead which could be attributed to nighttime flow regimes tested. Seventy-five percent of all steelhead tagged passed through the study area during flow tests. The second phase of the study was an evaluation of 1976 chinook and steelhead passage over lower Snake River dams (using fish counts). This passage was associated with nighttime flows of 0 and 20,000 cfs. on a 2-day alternating schedule. Using analysis of variance and Wilcoxon's signed-ranks test, no significant differences (.05 level) in counts of chinook or steelhead between the two nighttime test flow conditions were found, thus substantiating the 1975 findings.

SELECTED IRRIGATION RETURN FLOW QUALITY ABSTRACTS 1976, SIXTH ANNUAL ISSUE,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering
G. V. Skogerboe, S. W. Smith, and W. R. Walker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 925, Price codes: A14 in paper copy, A01 in microfiche Publication No EPA-600/2-78-042, March, 1978. 311 p.

Descriptors: Fertilizers, Irrigated land, *Salinity, *Return flow, *Bibliographies, Abstracts.

Research related to the quality of irrigation return flow is being conducted at numerous institutions throughout the western United States. Related work is also underway at other institutions in the United States, as well as other portions of the world. Approximately 100 sources of material have been searched for articles pertinent to the National Irrigation Return Flow Research and Development Program. These articles describe water quality problems resulting from irrigated agriculture, potential technological solutions for controlling return flows, recent research pertinent to return flow investigations, and literature associated with institutional constraints in irrigation return flow quality control. The first annual issue of Selected Irrigation Return Flow Quality Abstracts covered publications printed in 1968 and 1969, while the second annual issue lists publications printed in 1970 and 1971, the third annual issue covers calendar years 1972 and 1973, and the fourth and fifth annual issues cover literature published in 1974 and 1975. This annual issue lists publications printed in 1976. This report was submitted in fulfillment of Grant Number R-800426 under the sponsorship of the Office of Research and Development, Environmental Protection Agency. (Skogerboe-Colorado State)

W79-02585

WATER CONSERVATION INFORMATION DISSEMINATION DURING THE 1977 DROUGHT EMERGENCY,
Utah Center for Water Resources Research, Logan.
For primary bibliographic entry see Field 3B.
W79-02904

10D. Specialized Information Center Services

DESALINATION TECHNOLOGY TRANSFER CENTER,
Fairleigh Dickinson Univ., Teaneck, NJ. Coll. of Science and Engineering.
For primary bibliographic entry see Field 3A.
W79-02840

WATER CONSERVATION INFORMATION DISSEMINATION DURING THE 1977 DROUGHT EMERGENCY,
Utah Center for Water Resources Research, Logan.
For primary bibliographic entry see Field 3B.
W79-02904

SUBJECT INDEX

208 PLANS
Institutional Arrangements for Area-Wide Quality Planning and Management, Section 208 Applied in Three Metropolitan Areas of the Great Lakes,
W79-02819 5G

9-METHYLANTHRACENE
Bioaccumulation Potential of Polycyclic Aromatic Hydrocarbons in Daphnia Pulex,
W79-02982 5C

ABSORPTION
The Effects of Three Phthalate Esters on the Larval Development of the Grass Shrimp Palaemonetes Pugio (Holthuis),
W79-02786 5C

ACCRETION (LEGAL ASPECTS)
State Law Controls Title to Alluvial Formations Even Though Original Title is Based on Equal-Footing Doctrine or Federal Grant,
W79-02541 6E

ACIDIC WATER
Experience with Waste Water Acid Neutralization (Erfahrungen Mit Abwasser-Saurezneutralisation),
W79-02798 5D

Toxicity of Bog Water to Embryonic and Larval Anuran Amphibians,
W79-02837 5C

ACTIVATED CARBON
Upgrading Textile Operations to Reduce Pollution Volume 2; Wastewater Treatment Systems.
W79-02505 5D

Analysis of Models for Dichloramine Removal by Activated Carbon in Batch and Packed-Bed Reactors Using Quasilinearization and Orthogonal Collocation Methods,
W79-02640 5D

Feasibility of Removing Phenols from Surface Waters by Carbon Adsorption,
W79-02880 5D

ACTIVATED SLUDGE
Paper Pulp Compounds Containing Active Sludge,
W79-02941 5D

ADDITIVE TOXICITY
Acute Toxicity of Mercury and Selenium to Crassostrea Gigas Embryos and Cancer Magister Larvae,
W79-02973 5C

ADJACENT LAND OWNERS
Bauer v. Prestwich (Use of Water on Land Makes it Appurtenant to the Land).
W79-02563 6E

ADMINISTRATIVE AGENCIES
Organizing for a National Oceans Program,
W79-02556 6E

ADMINISTRATIVE DECISIONS
Federal Consistency with Approved Coastal Management Programs,
W79-02533 6E

Coastal Zone Management Approval Regulations,
W79-02535 6E

Consumer Notification - Public Awareness or the Smoking Pistol,
W79-02545 5G

ADOPTION OF PRACTICES
Federal Consistency with Approved Coastal Management Programs,
W79-02533 6E

Coastal Zone Management Approval Regulations,
W79-02535 6E

ADSORPTION
Adsorption, Mobility and Degradation of Cyanazine and Diuron in Soils,
W79-02909 5B

AERATED LAGOONS
The Effect of Temperature on Treatment Plant Performance and Related Temperature Studies,
W79-02618 5D

AERATION
The U-Tube for Water Aeration,
W79-02506 5D

Wind Powered Aeration for Remote Locations,
W79-02802 5G

AEROBIC DIGESTION
Aerobic Digestion of Wastewater Sludge Under Low Temperature Conditions,
W79-02911 5D

AEROBIC TREATMENT
Aerobic Digestion of Wastewater Sludge Under Low Temperature Conditions,
W79-02911 5D

AFRICAN
Africa B. The Remainder of Africa: Wet Coastal Ecosystems,
W79-02773 2L

AGENT ORANGE
Fate of 2,3,7,8-Tetrachlorodibenzo-P-Dioxin (TCDD) in the Environment: Summary and Decontamination Recommendations,
W79-02639 5B

AGGREGATES
Potential Alkali-Carbonate Rock Reactivity of Some of the Aggregate Used in Fishtrap Dam,
W79-02705 8F

Laboratory Tests of Concrete Aggregate and Riprap for New Lock and Dam No. 26,
W79-02854 8F

AGRICULTURAL CHEMICALS
Transport of Agricultural Chemicals from Small Upland Piedmont Watersheds,
W79-02745 5B

AGRICULTURAL WASTES
The Use of the Protococcaceae for Purifying Waste Water (Primeniye Protokokkovykh Vodorosley Dkya Ochiski Stochnykh Vod),
W79-02797 5D

AGRICULTURE
The Role of Agriculture, (Colorado River Basin),
W79-02738 3F

AIR POLLUTION
Upgrading Textile Operations to Reduce Pollution, Volume 1: In-Plant Control of Pollution.
W79-02504 5D

Long-Term Aspects of the Environmental Burden from Energy Production: CO2 and 3H, (In German),
W79-02855 5A

ALABAMA
Review and Analysis of Blasting and Vibrations at Bankhead Lock,
W79-02701 8H

Environmental Parameters of the Tennessee River in Alabama: II. Physical, Chemical, and Biological Parameters,
W79-02781 5A

Dew-Monitoring Network in the Southeast,
W79-02853 7B

ALASKA
Investigation of Slumping Failure in an Earth Dam Abutment at Kotzebue, Alaska,
W79-02702 8D

Salt Marshes of the Alaska Pacific Coast,
W79-02743 2L

The Salt Marsh Vegetation of China Poot Bay, Alaska,
W79-02744 2L

Environmental Studies of Kachemak Bay and Lower Cook Inlet, Volume VI: Food Habits of Shrimp in Kachemak Bay, Alaska,
W79-02780 2L

ALBERTA
Glacier Surveys in Alberta - 1975,
W79-02925 2C

ALBINISM
Accelerated Rate of Albinism in Channel Catfish Exposed to Metals,
W79-02967 5C

ALGAE
The Use of the Protococcaceae for Purifying Waste Water (Primeniye Protokokkovykh Vodorosley Dkya Ochiski Stochnykh Vod),
W79-02797 5D

Application of High Performance Liquid Chromatography to the Study of Dissolved Organic Phosphorus Compounds Released by Algae,
W79-02906 5A

Chromatographic Studies of Dissolved Organic Phosphorus Compounds Resulting from Algal Cultures,
W79-02907 5A

Effects of Salinity on Synthesis of DNA, Acidic Polysaccharide, and Growth in the Blue-Green Alga, Gomphosphaeria Aponina,
W79-02981 5C

ALGORITHMS
A Procedure to Determine Direct Diversions from Lake Michigan,
W79-02523 3D

ALKALI-AGGREGATE REACTIONS
Potential Alkali-Carbonate Rock Reactivity of Some of the Aggregate Used in Fishtrap Dam,
W79-02705 8F

ALKALINE WATER
pH Fluctuation in an Intertidal Beach in Bermuda,
W79-02842 2L

ALKYMERCURY COMPOUNDS
Determination of Alkylmercury Compounds in Lake Sediments by Steam Distillation-Flameless Atomic Absorption,
W79-02642 5A

ALLUVIUM
State Law Controls Title to Alluvial Formations Even Though Original Title is Based on Equal-Footing Doctrine or Federal Grant,
W79-02541 6E

Dissolution Potential of Surficial Mancos Shale and Alluvium,
W79-02827 5B

ALPHABETICAL LISTING
Water Resources Research Support Program 1978-1979,
W79-02928 6E

ALTERATION OF FLOW
Butts v. City of South Fulton (Construction of Road which Interfered with Natural Drainage and Caused Flooding Constituted Actionable Nuisance).
W79-02558 6E

ALTERNATIVE COSTS
An Economic Analysis of Alternative Federal Flood Damage Assistance Programs.
W79-02824 6F

ALTERNATIVE PLANNING
Environmental Assessment - Alternatives of General Management Plan and Wilderness Study for Cape Lookout National Seashore, North Carolina.
W79-02525 6G

Alternative Policies for Controlling Nonpoint Agricultural Sources of Water Pollution,
W79-02619 5G

ALTERNATIVES
NEPA's Effect on the Consideration of Alternatives: A Crucial Test,
W79-02607 5G

ALTITUDE
Photosynthetic Properties and Root Chilling Responses of Altitudinal Ecotypes of Typha Latifolia L.,
W79-02940 2I

ALUM
Chemical Sewage Sludge Disposal on Land (Lysimeter Studies) Volume II,
W79-02924 5E

AMMONIA
Microfluorometric Method to Measure Ammonium in Natural Waters,
W79-02847 2K

Determination of Submicromolar Concentrations of Ammonia in Natural Waters by a Standard Addition Method Using a Gas-Sensing Electrode,
W79-02848 2K

AMPHIBIANS
Toxicity of Bog Water to Embryonic and Larval Anuran Amphibians,
W79-02837 5C

ANAEROBIC DIGESTION
Anaerobic Digestion and Reverse Osmosis Separation for the Treatment of Domestic Liquid Waste,
W79-02826 5D

ANALYSIS
The Clean Water Act of 1977,
W79-02538 5G

Nondeterioration and the Protection of High Quality Waters Under Federal Water Pollution Control Law,
W79-02547 5G

ANALYTICAL TECHNIQUES
Methodology Developed for Assessment of Fish and Macroinvertebrate Communities in the New River, Virginia,
W79-02606 5C

Techniques for Sampling and Analyzing the Marine Macrobenthos,
W79-02627 5A

ANIMAL BEHAVIOUR
Osmotic Balance and Respiration in the Hermit Crab, Pagurus Bernhardus, Exposed to Fluctuating Salinities,
W79-02957 5C

ANIMAL METABOLISM
Detoxification of Metals by Marine Bivalves: An Ultrastructural Study of the Compartmentation of Copper and Zinc in the Oyster Ostrea Edulis,
W79-02784 5A

The Effects of Three Phthalate Esters on the Larval Development of the Grass Shrimp Palaemonetes Pugio (Holthuis),
W79-02786 5C

Arsenic Excretion by Monkeys Dosed with Arsenic-Containing Fish or With Inorganic Arsenic,
W79-02901 5C

ANIMAL PARASITES
Parasites and Related Pathology of the Cottontail Rabbit (Sylvilagus floridanus) in central Pennsylvania,
W79-02833 5C

ANIMAL PATHOLOGY
Parasites and Related Pathology of the Cottontail Rabbit (Sylvilagus floridanus) in central Pennsylvania,
W79-02833 5C

ANIMAL PHYSIOLOGY
The Effects of Three Phthalate Esters on the Larval Development of the Grass Shrimp Palaemonetes Pugio (Holthuis),
W79-02786 5C

Osmotic Balance and Respiration in the Hermit Crab, Pagurus Bernhardus, Exposed to Fluctuating Salinities,
W79-02957 5C

ANIMAL POPULATIONS
The Ecology of Palaemonetes Pugio in a Southeastern Salt Marsh Ecosystem with Particular Emphasis on Production and Trophic Relationships,
W79-02821 2L

ANIMAL WASTES (WILDLIFE)
Discharge of Solids from Fish Ponds,
W79-02970 5B

ANTAGONISM
Acute Toxicity of Mercury and Selenium to Crassostrea Gigas Embryos and Cancer Magister Larvae,
W79-02973 5C

ANTHRACENE
Bioaccumulation Potential of Polycyclic Aromatic Hydrocarbons in Daphnia Pulex,
W79-02982 5C

ANURAN LARVAE
Toxicity of Bog Water to Embryonic and Larval Anuran Amphibians,
W79-02837 5C

APPRAISALS
Linear Programming Model to Quantify Economic, Environmental and Social Values of a Tidal Marsh,
W79-02723 6B

APPROPRIATION
Oklahoma Water Resources Board v. City of Lawton (Springwater Heated as Stream Water for Appropriation Permit Application),
W79-02561 6E

AQICULTURE
A Fresh Water Waste Recycling-Aquaculture System,
W79-02759 5D

AQUATIC ANIMALS
Salt-Marsh Animals: Distributions Related to Tidal Flooding, Salinity and Vegetation,
W79-02767 2I

Plant and Animal Communities of Pacific North American Salt Marshes,
W79-02770 2L

AQUATIC ENVIRONMENT
Aquatic Resources and Recreation Behavior,
W79-02641 6B

Assessment and Implementation of In-Stream Value Studies for the Northern Great Plains,
W79-02709 4A

AQUATIC FUNGI
Host Specificity of Cercospora Rodmanii, A Potential Biological Control of Waterhyacinth,
W79-02884 4A

AQUATIC INVERTEBRATES
Diversity as a Measure of Benthic Macroinvertebrate Community Response to Water Pollution,
W79-02595 5C

AQUATIC LIFE
Neglected Marine Sanctuary Law is Showing Signs of Life,
W79-02540 6E

Species, Habitats and Processes Sensitive to OCS Development,
W79-02609 5C

AQUATIC MICROORGANISMS
The Influence of Environmental Factors on the Distribution, Composition, and Transport of Microbial Biomass and Suspended Material in a Salt Marsh Ecosystem,
W79-02673 5B

AQUATIC PLANT GROWTH
Field Estimates of Aquatic Plant Respiration and its Application of Stream Dissolved Oxygen Budgets,
W79-02816 5C

AQUATIC PLANTS
Nutrients, Toxins, and Water in Terrestrial and Aquatic Ecosystems Treated with Sewage Plant Effluents - Final Report of the Upland Recharge Program,
W79-02638 5D

Effects of Grass Carp Introduction on Macrophytic Vegetation and Chlorophyll Content of Phytoplankton in Four Florida Lakes,
W79-02758 2H

Gravity-Flow Irrigation and the Spread of Aquatic Weeds in Sudan,
W79-02930 4A

Salt Marsh Plant Geratology,
W79-02932 2I

The Seed Banks of Prairie Glacial Marshes,
W79-02933 2I

The Productivity of a Range of Blanket Bog Vegetation Types in the Northern Pennines,
W79-02945 2I

A Model of Stand Photosynthesis for the Wet Meadow Tundra at Barrow, Alaska,
W79-02946 2I

Influences of Spring Water Levels on Aquatic and Riparian Plant Distribution in Upper Richelieu and Missisquoi Bay Areas,
W79-02950 2H

AQUATIC POPULATIONS
Methodology Developed for Assessment of Fish and Macroinvertebrate Communities in the New River, Virginia,
W79-02606 5C

Design and Evaluation of Laboratory Ecological System Studies,
W79-02625 5C

AQUATIC WEED CONTROL
The White Amur as a Biological Control Agent of Aquatic Weeds in the Panama Canal,
W79-02892 5G

AQUICULTURE
Untersuchungen Zur Intensivhaltung Von Fischen Im Warm-Wasserkreislauf (Studies Regarding Intensified Fish Culture in a Closed Warm Water System),
W79-02896 5C

Discharge of Solids from Fish Ponds,
W79-02970 5B

AQUICULTURE *FISH HATCHERY
Hatchery Alarm System to Protect Against Catastrophic Egg of Fish Kills,
W79-02977 5G

AQUIFER CHARACTERISTICS
Water Wells and Springs in Palo Verde Valley, Riverside and Imperial Counties, California,
W79-02647 7C

Groundwater in the Newberg Area, Northern Willamette Valley, Oregon,
W79-02650 2F

Preliminary Appraisal of the Geohydrologic Aspects of Drainage Wells, Orlando Area, Central Florida,
W79-02656 4B

Preliminary Hydrologic Budget of the Sand-and-Gravel Aquifer Under Unstressed Conditions, with a Section on Water-Quality Monitoring, Pensacola, Florida,
W79-02664 5B

ARCTIC
Trophic Interactions.
W79-02610 5C

Probable Impacts and Consequences of Oil Development,
W79-02611 5C

A Biologist Looks at Oil in the Sea,
W79-02615 5G

Preferred Crystal Orientations in the Fast Ice Along the Margins of the Arctic Ocean,
W79-02850 2C

ARCTIC OCEAN
Preferred Crystal Orientations in the Fast Ice Along the Margins of the Arctic Ocean,
W79-02850 2C

AREA-WIDE WATER QUALITY PLANNING
Institutional Arrangements for Area-Wide Quality Planning and Management, Section 208 Applied in Three Metropolitan Areas of the Great Lakes,
W79-02819 5G

ARID LANDS
Isotope Hydrology of Inland Sabkhas in the Bardawil Area, Sinai,
W79-02841 2H

ARIZNA
Analysis of Gravity Data from the Picacho Basin, Pinal County, Arizona,
W79-02599 7C

ARIZONA
Certain Water Right Claims of the AK-Chin Indian Community,
W79-02530 6E

Prediction of Hydraulic Conductivity Changes Using Soil Characteristics,
W79-02600 2G

Developing Procedures for Predicting Effectiveness in Seepage Control,
W79-02820 4A

Probabilistic Analysis of Water Availability in Power Plant Site Selection,
W79-02834 3E

A Multiobjective Approach to Managing a Southern Arizona Watershed,
W79-02881 4D

ARKANSAS
Water Resources Data for Arkansas, Water Year 1977.
W79-02666 7C

ARKANSAS RIVER BASIN
Water Resources Data for Oklahoma, Water Year 1977--Volume 1. Arkansas River Basin.
W79-02667 7C

ARKANSAS RIVER RESERVOIRS (COLO)
Transit Losses and Traveltimes of Reservoir Releases along the Arkansas River from Pueblo Reservoir to John Martin Reservoir, Southeastern Colorado,
W79-02659 4A

ARSENATE
Cathodic Stripping Methods for the Determination of Phosphate and Arsenate in Natural Waters,
W79-02602 5A

ARSENIC
The Effect of Arsenic on the Thermal Tolerance and Survival of Newly Hatched Muskellunge Fry (Esox Masquinongy),
W79-02587 5C

Arsenic Excretion by Monkeys Dosed with Arsenic-Containing Fish or With Inorganic Arsenic,
W79-02901 5C

ARSENIC COMPOUNDS
Arsenic Excretion by Monkeys Dosed with Arsenic-Containing Fish or With Inorganic Arsenic,
W79-02901 5C

Accelerated Rate of Albinism in Channel Catfish Exposed to Metals,
W79-02967 5C

ARTESIAN AQUIFERS
Development of Cavity Type Tubewells,
W79-03000 8B

ARTESIAN WELLS
Nicomekl-Serpentine Basin Study, British Columbia,
W79-02785 4B

ARTIFICIAL ISLANDS
Effects of Gravel Mining and Construction of Gravel Islands and Causeways.
W79-02612 5C

Ecological Effects of an Artificial Island, Rincon Island Punta Gorda, California,
W79-02614 6G

ARTIFICIAL LAKES
Gravity-Flow Irrigation and the Spread of Aquatic Weeds in Sudan,
W79-02930 4A

ASIA
Water Balance of Asia, (In Russian),
W79-02866 2A

ATHABASCA GLACIER
Glacier Surveys in Alberta - 1975,
W79-02925 2C

ATLANTIC COASTAL PLAIN
Mangals and Salt Marshes of Eastern United States,
W79-02769 2L

Tidal Salt-Marsh and Mangal Formations of Middle and South America,
W79-02771 2L

ATLANTIC OCEAN
An Oilspill Risk Analysis for the Mid-Atlantic (Proposed Sale 49) Outer Continental Shelf Lease Area,
W79-02661 5G

Fine Structure Instabilities Induced by Double Diffusion in the Shelf/Slope Water Front,
W79-02851 2L

An Exposure Scale for Marine Shores in Western Norway,
W79-02964 5B

ATRAZINE
Atrazine Persistence in a Valentine Loamy Fine Sand Profile,
W79-02910 5A

Plant Competition for Atrazine,
W79-02985 5A

ATTITUDES
Issues, Interests and Power: Environmental Politics in the Community Setting,
W79-02825 6B

Social Impacts from Wildlife Within the Columbia Basin Irrigation District,
W79-02839 6B

AUSTRALIA
High-Magnesium Calcite Ooids from the Great Barrier Reef,
W79-02999 2L

AVIAN POPULATION
Avian Communities and Habitat Components in Natural and Wastewater-Irrigated Environments,
W79-02601 5G

AVULSION
Equal Footing Doctrine does not Require Application of Federal Common Law to Resolve Ownership of Land Underlying Navigable Waterways which are not Interstate Boundaries,
W79-02551 6E

BACK RIVER (MD)
Volatile Chloro- and Bromocarbons in Coastal Waters,
W79-02684 5B

BACTERIA
Microbial Degradation of Pesticides,
W79-02583 5

Feasibility of Using Bacterial Strains (Mutagenesis) to Test for Environmental Carcinogens,
W79-02626 5C

Bacteriological Water Quality of Tulpehocken Creek Basin, Berks and Lebanon Counties, Pennsylvania,
W79-02654 5B

BACTERIAL NITRIFICATION
Untersuchungen Zur Intensivhaltung Von Fischen Im Warm-Wasserkreislauf (Studies Regarding Intensified Fish Culture in a Closed Warm Water System),
W79-02896 5C

BANKHEAD LOCK (AL)
Review and Analysis of Blasting and Vibrations at Bankhead Lock,
W79-02701 8H

BARDAWIL AREA (SINAI)
Isotope Hydrology of Inland Sabkhas in the Bardawil Area, Sinai,
W79-02841 2H

BASELINE STUDIES
Environmental Assessment of the Alaskan Continental Shelf. Interim Synthesis: Beaufort/Chukchi.
W79-02608 5C

Bacteriological Water Quality of Tulpehocken Creek Basin, Berks and Lebanon Counties, Pennsylvania,
W79-02654 5B

Taste and Odor, Missouri River, Iowa Tributaries Area, Iowa-Nebraska, 1970.
W79-02811 5G

Distribution and Abundance of Benthic Organisms in the New York Bight, First and Second Monitoring Cruises, November 1975 and March 1976,
W79-02922 5C

BASINS
Surface Water Resources of Northwest Florida,
W79-02727 2E

BASS
Cadmium and Zinc Content of Fish from an Industrially Contaminated Lake,
W79-02888 5A

BATHYMETRY
Assessment and Implementation of In-Stream Value Studies for the Northern Great Plains,
W79-02709 4A

BAYES ANALYSIS
Uncertainties of Karstic Water Resources Systems,
W79-02883 2F

BEACHES
pH Fluctuation in an Intertidal Beach in Bermuda,
W79-02842 2L

BEHAVIORAL REACTIONS
The Detection of Heightened Sea-Water Copper Concentrations by the Mussel Mytilus Edulisl,
W79-02960 5A

BENEFICIAL USE
Hodges v. Oklahoma Water Resources Board (Water Resources Board Grant of Temporary Permit for Non-Domestic Groundwater Use Upheld).
W79-02557 6E

Kuiper v. Warren (Conditional Well Permit Owner Must Apply Water to Beneficial Use or Lose Permit).
W79-02562 6E

BENTHIC FAUNA
Diversity as a Measure of Benthic Macroinvertebrate Community Response to Water Pollution,
W79-02595 5C

Methodology Developed for Assessment of Fish and Macroinvertebrate Communities in the New River, Virginia,
W79-02606 5C

Techniques for Sampling and Analyzing the Marine Macrobenthos,
W79-02627 5A

Studies of the Invertebrate Fauna of a Wet Slack in a Sand Dune System,
W79-02948 2L

The Physical Environment and Bottom Fauna of a Bog Lake,
W79-02949 2H

BENTHOS
Distribution and Abundance of Benthic Organisms in the New York Bight, First and Second Monitoring Cruises, November 1975 and March 1976,
W79-02922 5C

BENZ (A)ANTHRACENE
Bioaccumulation Potential of Polycyclic Aromatic Hydrocarbons in Daphnia Pulex,
W79-02982 5C

BENZENE
Problem Definition Studies on Potential Environmental Pollutants, IV: Physical, Chemical, Toxicological, and Biological Properties of Benzene; Toluene; Xylenes; and P-Chlorophenyl Methyl Sulfide, Sulfoxide, and Sulfone.
W79-02637 5G

BENZENE HEXACHLORIDE
Toxicity of Selected Chemicals to the Fairy Shrimp, Streptocephalus Seali, Under Laboratory and Field Conditions,
W79-02971 5C

BENZO (A)PYRENE MONOXYGENASE
Benzo(A)Pyrene Monooxygenase Induction in Marine Fish -Molecular Response to Oil Pollution,
W79-02898 5C

BERMUDA
pH Fluctuation in an Intertidal Beach in Bermuda,
W79-02842 2L

BERMUDAGRASS
Responses of Bermudagrass to Salinity,
W79-02993 3C

BIBLIOGRAPHIES
Selected Irrigation Return Flow Quality Abstracts 1976, Sixth Annual Issue,
W79-02580 10C

The Use of Potassium Permanganate (KMNO4) in Fisheries; A Literature Review.
W79-02585 5G

BIOLOGICAL MEMBRANES
Detoxification of Metals by Marine Bivalves: An Ultrastructural Study of the Compartmentation of Copper and Zinc in the Oyster Ostrea Edulis,
W79-02784 5A

BIOLOGICAL TREATMENT
Upgrading Textile Operations to Reduce Pollution Volume 2; Wastewater Treatment Systems.
W79-02505 5D

A Fresh Water Waste Recycling-Aquaculture System,
W79-02759 5D

Effects of Wastewater Process Operation on Organics in Potable Water Supplies,
W79-02815 5D

BIOMASS
Plant Biomass and Net Primary Production Along a Flood-Frequency Gradient in the Streamside Forest,
W79-02761 2I

Salt Marsh Plant Geratology,
W79-02932 2I

BIOMONITORING
A Biomonitoring Procedure Utilizing Negative Photoaxis of First Instar Aedes Aegypti Larvae,
W79-02593 5A

BIOTA
Probable Impacts and Consequences of Oil Development,
W79-02611 5C

BIOTRANSFERENCE
Effect of Mercury on NADH and the Protective Role of Oxalacetate,
W79-02596 5D

BIRDS
Avian Communities and Habitat Components in Natural and Wastewater-Irrigated Environments,
W79-02601 5G

Problem Definition Studies on Potential Environmental Pollutants, IV: Physical, Chemical, Toxicological, and Biological Properties of Benzene; Toluene; Xylenes; and P-Chlorophenyl Methyl Sulfide, Sulfoxide, and Sulfone.
W79-02637 5G

Bird Use of Anaheim Bay: A Southern California Salt Marsh,
W79-02724 2L

BISCAYNE AQUIFER (FLA)
Effects of Bottom Sediments on Infilration from the Miami and Tributary Canals to the Biscayne Aquifer, Dade County, Florida,
W79-02653 5B

BLACK CREEK WATERSHED (GEO)
Preimpoundment Study Little Black Creek Drainage Basn Black Creek Watershed Bulloch County, Georgia,
W79-02635 5C

BLEACHING WASTES
Colour and Toxicity Removal from Bleach Plant Effluents Using a Higgins Contactor,
W79-02953 5D

BLOCK NETS
Technique for Collecting Fish with a Block Net in a Pumped Storage Reservoir,
W79-02976 7B

BOGS
Toxicity of Bog Water to Embryonic and Larval Anuran Amphibians,
W79-02837 5C

The Productivity of a Range of Blanket Bog Vegetation Types in the Northern Pennines,
W79-02945 2I

The Physical Environment and Bottom Fauna of a Bog Lake,
W79-02949 2H

Biological Foundations of Forest Drainage Efficiency,
W79-02951 2I

BONNEVILLE DAM
Silt Sampling Study, Bonneville Spillway Dam, Bonneville, Oregon.
W79-02861 8D

BOREHOLE GEOPHYSICS
Results of In Situ Modulus of Deformation Test, Cannelton Lock and Dam,
W79-02710 8E

BRINE SHRIMP
Toxicity-, Accumulation-, and Elimination Studies of Alpha-Hexachlorocyclohexane (Alpha-HCH) with Saltwater Organisms of Different Trophic Levels,
W79-02889 5C

BRITISH COLUMBIA
Nicomekl-Serpentine Basin Study, British Columbia,
W79-02785 4B

Principal Components Analysis of Glacier-Climatological Data for Sentinel Glacier, British Columbia,
W79-02927 2C

BROMIDES
Use of Neutron Activatable Tracers for Simulating Water and Chemical Flow Through Porous Media,
W79-02814 5B

BRUCE
An Appraisal of the Hydrogeological Processes Involved in Shallow Subsurface Radioactive Waste Management in Canadian Terrain,
W79-02926 5B

BUNKER C OIL
Effects of Bunker C Oil and an Oil Dispersant: Part 2--Effects on the Accumulation of Chlorine-Labelled Bunker C Oil in Various Fish Tissues,
W79-02620 5C

CADMIUM
Concentrations of Ten Heavy Metals in Some Selected Lake Powell Game Fishes,
W79-02582 5B

Trace Metals in Some Fish Species of South Carolina,
W79-02887 5A

Cadmium and Zinc Content of Fish from an Industrially Contaminated Lake,
W79-02888 5A

Actions Ecotoxicologiques de Certains Metaux (CU-ZN-PB-CD) Chez Les Poissons Dulcaquicoles De La Riviere Lot (The Ecotoxicological Action of some Metals (CU-ZN-PB-CD) on Freshwater Fish in the Lot River,
W79-02895 5C

Acumulacion and Efectos Histopatologicos Del Cadmio Y El Mercurio En El Sapo (Halobatrachus Didactylus) (Accumulation and Histopathological Effect of Cadmium and of Mercury on the Sapo),
W79-02959 5C

Accelerated Rate of Albinism in Channel Catfish Exposed to Metals,
W79-02967 5C

An Improved Experimental Medium for Freshwater Toxicity Studies Using Daphnia Magna,
W79-02972 5C

Interactions of Methylmercury, Cadmium, and Salinity on Regeneration in the Fiddler Crabs Uca Pugilator, U. Pugnax and U. Minax,
W79-02974 5C

CALCIUM CARBONATE
Satellite Observations of Calcium Carbonate Precipitations in the Great Lakes,
W79-02685 7B

CALIFORNIA
California's Program for Dealing with the Drought,
W79-02544 6E

Protecting the California Coast.
W79-02554 6E

Estimated Agricultural Ground-Water Pumpage in Parts of Fresno, Kings, and Madera Counties, San Joaquin Valley, California, 1974-77,
W79-02658 4B

Distribution of Dissolved Nitrate and Fluoride in Ground Water, Highland-East Highlands, San Bernardino County, California,
W79-02663 5B

Non-Point Source Water Quality Monitoring, Inyo National Forest, 1975,
W79-02718 5A

Bird Use of Anaheim Bay: A Southern California Salt Marsh,
W79-02724 2L

CANADA
Accuracy of Canadian Snow Gage Measurements,
W79-02681 2B

Trace Metals in the Waters of a Partially Mixed Estuary,
W79-02687 2K

Nicomekl-Serpentine Basin Study, British Columbia,
W79-02785 4B

Chemical Limnology of the North Channel, 1974,
W79-02921 5A

CANADA

Chemical Limnology of Georgian Bay, 1974,
W79-02923 5A

Glacier Surveys in Alberta - 1975,
W79-02925 2C

Principal Components Analysis of Glacier-Climatological Data for Sentinel Glacier, British Columbia,
W79-02927 2C

Water Resources Research Support Program 1978-1979,
W79-02928 6E

Sublethal Effects of Treated Liquid Effluent from a Petroleum Refinery on Freshwater Organisms,
W79-02929 5C

Wastewater Disinfection in Canada,
W79-02935 5D

The Relationship Between Net Primary Production and Accumulation for a Peatland in Southeastern Manitoba,
W79-02938 5C

Nutrient-Phytoplankton Relationships in the Holland Marsh, Ontario,
W79-02944 5C

CANAL ZONE
The White Amur as a Biological Control Agent of Aquatic Weeds in the Panama Canal,
W79-02892 5G

CANALS
Effects of Bottom Sediments on Infilration from the Miami and Tributary Canals to the Biscayne Aquifer, Dade County, Florida,
W79-02653 5B

Investigation of Natural Sealing Processes in Irrigation Canals and Reservoirs,
W79-02905 4A

Gravity-Flow Irrigation and the Spread of Aquatic Weeds in Sudan,
W79-02930 4A

CANNELTON LOCK AND DAM (OHIO RIVER)
Results of In Situ Modulus of Deformation Test, Cannelton Lock and Dam,
W79-02710 8E

CARBOHYDRATES (HIGH MOLECULAR WEIGHT)
Chitosan -- A Polymer from Seafood Waste, for use in Treatment of Food Processing Wastes and Activated Sludge,
W79-02513 5D

CARBON CYCLE
A Conceptual Ecological Model for Chesapeake Bay,
W79-02746 2L

CARCIONGENS
Feasibility of Using Bacterial Strains (Mutagenesis) to Test for Environmental Carcinogens,
W79-02626 5C

CARP
Untersuchungen Zur Intensivhaltung Von Fischen Im Warm-Wasserkreislauf (Studies Regarding Intensified Fish Culture in a Closed Warm Water System),
W79-02896 5C

CARRYING CAPACITY
Carrying Capacity and Planning, (Colorado River Basin),
W79-02741 6B

CASPER AQUIFER (WYO)
Well Field Site Selection Based on Geologic Criteria that Influence Ground Water Circulation in the Vicinity of Laramie, Wyoming,
W79-02912 4B

CATHODIC STRIPPING METHOD
Cathodic Stripping Methods for the Determination of Phosphate and Arsenate in Natural Waters,
W79-02602 5A

CATTAILS
Photosynthetic Properties and Root Chilling Responses of Altitudinal Ecotypes of Typha Latifolia L.,
W79-02940 2I

CATTLE
Cattle, Wildlife, and Riparian Habitats in the Western Dakotas,
W79-02760 2I

CAVITATION
The Oxford University Water Cavitation Tunnel. Description and Operating Procedures,
W79-02860 8B

CAVITY WELLS
Development of Cavity Type Tubewells,
W79-03000 8B

CELTIC SEA
A Note on the Circulation Induced by a Shallow-Sea Front,
W79-02688 2L

CEMENT GROUTING
Spray Grouting: Summary of Research, Development, Utilization, and Future Uses,
W79-02863 8F

CENSUS
Bird Use of Anaheim Bay: A Southern California Salt Marsh,
W79-02724 2L

CERCOSPORA RODMANII
Host Specificity of Cercospora Rodmanii, A Potential Biological Control of Waterhyacinth,
W79-02884 4A

CHALK RIVER
An Appraisal of the Hydrogeological Processes Involved in Shallow Subsurface Radioactive Waste Management in Canadian Terrain,
W79-02926 5B

CHANNEL CATFISH
Use of Histologic and Histochemical Assessments in the Prognosis of the Effects of Aquatic Pollutants,
W79-02877 5C

CHANNEL IMPROVEMENT
Effects of Channelization of the Luxapalila River on Fish, Aquatic Invertebrates, Water Quality and Furbearers,
W79-02636 5C

CHANNEL MORPHOLOGY
Unsteady Streamflow Simulation Using a Linear Implicit Finite-Difference Model,
W79-02644 2E

CHANNELS
Effects of Channelization of the Luxapalila River on Fish, Aquatic Invertebrates, Water Quality and Furbearers,
W79-02636 5C

CHATTAHOOCHEE RIVER (GEO)
Impact of Flow Regulation and Power Plant Effluents on the Flow and Temperature Regimes of the Chattahochee River -- Atlanta to Whitesburg, Georgia,
W79-02648 5B

CHEMICAL ANALYSIS
Characterization of Product Tanker Slop Waters,
W79-02805 5B

A Rapid and Precise Method for Determining Sulfate in Seawater, Estuarine Waters, and Sediment Pore Water,
W79-02846 2K

Microfluorometric Method to Measure Ammonium in Natural Waters,
W79-02847 2K

Determination of Submicromolar Concentrations of Ammonia in Natural Waters by a Standard Addition Method Using a Gas-Sensing Electrode,
W79-02848 2K

Rapid Method for Determining Concentrations of Bayer 73 in Water During Lampricide Treatments,
W79-02891 5A

Chemical Analysis of Mine Drainage Waters,
W79-02918 5A

Chemical Limnology of the North Channel, 1974,
W79-02921 5A

CHEMICAL DEGRADATION
Handbook for Pesticide Disposal by Common Chemical Methods,
W79-02806 5E

CHEMICAL OXYGEN DEMAND
Effects of Wastewater Process Operation on Organics in Potable Water Supplies,
W79-02815 5D

CHEMICAL PRECIPITATION
Chemical Treatment for Organic Color Removal from Groundwaters,
W79-02782 5D

CHEMICAL REACTIONS
Elimination of Water Pollution by Recycling Cement Plant Kiln Dust,
W79-02509 5D

Chemical Treatment for Organic Color Removal from Groundwaters,
W79-02782 5D

CHEMICAL WASTES
Feasibility of Using Bacterial Strains (Mutagenesis) to Test for Environmental Carcinogens,
W79-02626 5C

Aquatic Field Surveys at Holston Army Ammunition Plant, Kingsport Tennessee, Final Report,
W79-02630 5C

Waste Disposal Study. Evaluation of Methods to Recover Reusable Chemicals from Evaporated Photowastes,
W79-02809 5E

CHEMICALS
Chemical Limnology of Georgian Bay, 1974,
W79-02923 5A

Chemical Sewage Sludge Disposal on Land (Lysimeter Studies) Volume II,
W79-02924 5E

CHESAPEAKE BAY
A Report on the Concentration, Distribution and Impact of Certain Trace Metals from Sewage Treatment Plans on the Chesapeake Bay,
W79-02511 5B

A Conceptual Ecological Model for Chesapeake Bay,
W79-02746 2L

CHINA POOT BAY (ALAS)
The Salt Marsh Vegetation of China Poot Bay, Alaska,
W79-02744 2L

CHINOOK SALMON
Effects of Reduced Nighttime Flow on Upstream Migration of Adult Chinook Salmon and Steelhead Trout in the Lower Snake River,
W79-02919 8I

CHITOSAN
Chitosan -- A Polymer from Seafood Waste, for use in Treatment of Food Processing Wastes and Activated Sludge,
W79-02513 5D

CHLORDANE
Chronic Toxicity of Chlordane, Trifluralin, and Pentachlorophenol to Sheepshead Minnows (Cyprinodon Variegatus),
W79-02631 5C

CHLORINATED HYDROCARBON PESTICIDES
Microbial Degradation of Pesticides,
W79-02583 5

Toxicity of Selected Chemicals to the Fairy Shrimp, Streptocephalus Seali, Under Laboratory and Field Conditions,
W79-02971 5C

CHLORINATION
Volatile Chloro- and Bromocarbons in Coastal Waters,
W79-02684 5B

CHROMATOGRAPHY
Application of High Performance Liquid Chromatography to the Study of Dissolved Organic Phosphorus Compounds Released by Algae,
W79-02906 5A

Chromatographic Studies of Dissolved Organic Phosphorus Compounds Resulting from Algal Cultures,
W79-02907 5A

CHROMIUM
Concentrations of Ten Heavy Metals in Some Selected Lake Powell Game Fishes,
W79-02582 5B

CLASSIFICATION
Assessment of the Physical and Biological Characteristics of the Major Lake Champlain Wetlands,
W79-02937 2H

A Preliminary Classification of Wetland Plant Communities in North-Central Minnesota,
W79-02956 2I

CLAYS
Adsorption, Mobility and Degradation of Cyanazine and Diuron in Soils,
W79-02909 5B

CLIMATES
Climate: Wet Coastal Ecosystems,
W79-02765 2B

CLIMATOLOGY
Principal Components Analysis of Glacier-Climatological Data for Sentinel Glacier, British Columbia,
W79-02927 2C

CLOUD SEEDING
Weather Modification Activities in Texas, 1974-77.
W79-02699 3B

COAGULATION
Polymer Coagulation of Humic Acid Waters,
W79-02715 5D

Coagulation of Monodisperse Collodal Particles in Locally Isotropic Turbulent Flows,
W79-02873 5D

COAL MINE WASTES
A Chemical and Biological Evaluation of Three Mine Drainage Treatment Plants,
W79-02794 5D

COAL MINES
Selected Hydrologic Data, 1931-77, Wasatch Plateau-Book Cliffs Coal-Fields Area, Utah,
W79-02645 7C

COALS
Fossil Plants and Coal: Patterns of Change in Pennsylvania Coal Swamps of the Illinois Basin,
W79-02955 2H

COASTAL MARSHES
Tidelands and the Public Trust: An Application for South Carolina,
W79-02539 6E

Ecosystems of the World 1: Wet Coastal Ecosystems.
W79-02762 2L

Introduction; Wet Coastal Ecosystems,
W79-02763 2L

The Coastal Salt Marshes of Western and Northern Europe: An Ecological and Phytosociological Approach,
W79-02768 2L

Mangals and Salt Marshes of Eastern United States,
W79-02769 2L

COASTAL PLAINS
Federal Consistency with Approved Coastal Management Programs,
W79-02533 6E

Coastal Zone Management Approval Regulations,
W79-02535 6E

COASTAL STRUCTURES
Rules and Procedures for Application for Coastal Construction Permits.
W79-02559 6E

COASTS
Laws Passed During the 1976 Session of the Mississippi Legislature (concerning Maine and Coastal Zone),
W79-02526 6E

Laws Passed During the 1975 Session of the Mississippi Legislature (Concerning Marine and Coastal Zone),
W79-02528 6E

Protecting the California Coast.
W79-02554 6E

Ocean and Coastal Law Teaching Materials Vol. II - Coastal Law,
W79-02578 6E

Vulnerability of Coastal Environments to Oil Spill Impacts,
W79-02616 5G

A Note on the Circulation Induced by a Shallow-Sea Front,
W79-02688 2L

Preferred Crystal Orientations in the Fast Ice Along the Margins of the Arctic Ocean,
W79-02850 2C

Hydrodynamic Transport Phenomena in Estuaries and Coastal Waters. Scope of Mathematical models,
W79-02983 2L

COCCIDIOSIS
Parasites and Related Pathology of the Cottontail Rabbit (Sylvilagus floridanus) in central Pennsylvania,
W79-02833 5C

COLD REGIONS
Environmental Hazards to Offshore Operations.
W79-02613 5C

Effect of Subzero Temperature in Concrete on the Nature of Operations of High Concrete Dams,
W79-02690 8F

Coefficient of Linear Expansion of Massive Concrete at a Negative Temperature,
W79-02692 8F

Constructing Concrete Dams in Regions with Subzero Average Yearly Temperature,
W79-02697 8F

COLD WEATHER CONSTRUCTION
Concrete Placing Techniques Used During the Construction of the Krasnoiarsk Hydroelectric Power Plant,
W79-02691 8F

Specific Features of Construction of Thawed Soil Dams in Severe Climate Conditions,
W79-02693 8D

Thermal Regime of Earth-Rock Dams Constructed in the Far North,
W79-02694 8D

Fundamentals of Constructing Frozen Type Earth Dams in the Arctic,
W79-02695 8D

Evaluation of Stability of Earth-Fill Dam Based on Strength of Frozen Zones of its Profile,
W79-02696 8D

Constructing Concrete Dams in Regions with Subzero Average Yearly Temperature,
W79-02697 8F

Investigation of Slumping Failure in an Earth Dam Abutment at Kotzebue, Alaska,
W79-02702 8D

Dam of the Anadyrsk Thermal Electric Power Station,
W79-02862 8D

Designing Concrete Dams for Especially Harsh Climatic Conditions,
W79-02864 8F

Cryopedological Research in the Construction of Dams Under Severe Climatic Conditions,
W79-02867 8D

Dam Design and Construction in the USSR's North and Siberia,
W79-02868 8D

Recommended Practice for the Design and Construction of Earth Dams for Industrial and Potable Water Supply in the Far North and Permafrost Areas.
W79-02871 8D

COLIFORMS
Bacteriological Water Quality of Tulpehocken Creek Basin, Berks and Lebanon Counties, Pennsylvania,
W79-02654 5B

COLLOIDS
Coagulation of Monodisperse Collodal Particles in Locally Isotropic Turbulent Flows,
W79-02873 5D

COLOR
Chemical Treatment for Organic Color Removal from Groundwaters,
W79-02782 5D

COLORADO
'Best Management Practices' for Salinity Control in Grand Valley,
W79-02521 5G

Kuiper v. Warren (Conditional Well Permit Owner Must Apply Water to Beneficial Use or Lose Permit).
W79-02562 6E

Peterson v. Ground Water Commission (Evidence of Overappropriated Ground Water Resources Sufficient to Deny Well Construction Permit Application).
W79-02568 6E

Evaluation of Irrigation Methods for Salinity Control in Grand Valley,
W79-02594 5G

Hydrologic Data for Urban Storm Runoff from Three Localities in the Denver Metropolitan Area, Colorado,
W79-02646 7C

Transit Losses and Traveltimes of Reservoir Releases along the Arkansas River from Pueblo Reservoir to John Martin Reservoir, Southeastern Colorado,
W79-02659 4A

Effects of Water Drawdown on the Fauna in Small Cold-Water Reservoirs,
W79-02830 4A

Irrigation of Urban Lawns,
W79-02832 3D

COLORADO (FRONT RANGE)
Chemical Analysis of Mine Drainage Waters,
W79-02918 5A

COLORADO RIVER
Colorado River Development, (Colorado River Basin),
W79-02734 6E

COLORADO RIVER BASIN
Values and Choices in the Development of the Colorado River Basin.
W79-02732 6B

Physical Setting, (Colorado River Basin),
W79-02733 4A

Colorado River Development, (Colorado River Basin),
W79-02734 6E

Politics of Water Allocation, (Colorado River Basin),
W79-02735 6E

Policy Goals and Values in Historical Perspective, (Colorado River Basin),
W79-02736 6B

Energy Resources Development, (Colorado River Basin),
W79-02737 3E

The Role of Agriculture, (Colorado River Basin),
W79-02738 3F

Recreation, (Colorado River Basin),
W79-02739 6B

Community Development, (Colorado River Basin),
W79-02740 6B

Carrying Capacity and Planning, (Colorado River Basin),
W79-02741 6B

Dissolution Potential of Surficial Mancos Shale and Alluvium,
W79-02827 5B

COLUMBIA RIVER
Silt Sampling Study, Bonneville Spillway Dam, Bonneville, Oregon.
W79-02861 8D

COLUMBIA RIVER BASIN
Social Impacts from Wildlife Within the Columbia Basin Irrigation District,
W79-02839 6B

COMMERCIAL FISH
Acumulacion and Efectos Histopatologicos Del Cadmio Y El Mercurio En El Sapo (Halobatrachus Didactylus) (Accumulation and Histopathological Effect of Cadmium and of Mercury on the Sapo),
W79-02959 5C

Correlations of Fish Catch and Environmental Factors in the Gulf of Maine,
W79-02997 2L

COMMERCIAL SHELLFISH
Correlations of Fish Catch and Environmental Factors in the Gulf of Maine,
W79-02997 2L

COMMUNITY DEVELOPMENT
Community Development, (Colorado River Basin),
W79-02740 6B

Issues, Interests and Power: Environmental Politics in the Community Setting,
W79-02825 6B

COMPETING USES
Oklahoma Water Resources Board v. City of Lawton (Springwater Heated as Stream Water for Appropriation Permit Application),
W79-02561 6E

COMPETITION
Relations Between Soil Nutrients and Vegetation in Wetheaths. II. Nutrient Uptake by the Major Species in the Field and in Controlled Conditions,
W79-02939 2H

COMPONENTS LOADINGS
Principal Components Analysis of Glacier-Climatological Data for Sentinel Glacier, British Columbia,
W79-02927 2C

COMPUTER MODELS
Environmental Impact Assessment.
W79-02524 6G

Preliminary Hydrologic Budget of the Sand-and-Gravel Aquifer Under Unstressed Conditions, with a Section on Water-Quality Monitoring, Pensacola, Florida,
W79-02664 5B

COMPUTER PROGRAMS
Introduction to the Model State Information System (MSIS).

CONCRETE
Coefficient of Linear Expansion of Massive Concrete at a Negative Temperature,
W79-02692 8F

Laboratory Tests of Concrete Aggregate and Riprap for New Lock and Dam No. 26,
W79-02854 8F

CONCRETE DAMS
Concrete Placing Techniques Used During the Construction of the Krasnoiarsk Hydroelectric Power Plant,
W79-02691 8F

Coefficient of Linear Expansion of Massive Concrete at a Negative Temperature,
W79-02692 8F

Constructing Concrete Dams in Regions with Subzero Average Yearly Temperature,
W79-02697 8F

Designing Concrete Dams for Especially Harsh Climatic Conditions,
W79-02864 8F

CONCRETE STRUCTURES
Constructing Concrete Dams in Regions with Subzero Average Yearly Temperature,
W79-02697 8F

Nonmetallic Waterstops,
W79-02712 8F

CONCRETE TESTING
Potential Alkali-Carbonate Rock Reactivity of Some of the Aggregate Used in Fishtrap Dam,
W79-02705 8F

CONFERENCES
Something Old, Something New: Some Thoughts on Grotius and the Marine Environment,
W79-02553 6E

Residual Management by Land Disposal, Proceedings of the Hazardous Waste Research Symposium.
W79-02810 5E

CONGAREE RIVER (SC)
Notes on the Flora of the Congaree River Floodplain, Richland County, South Carolina,
W79-02756 2I

CONSOLIDATION
Analysis of Consolidation of Earth and Rockfill Dams, Volume I, Main Text and Appendices A and B,
W79-02875 8D

CONSTANT WATER LEVEL DEVICE
Inexpensive Constant Water Level Device for Flow-Through Aquariums,
W79-02995 7B

CONSUMPTIVE USE
Las Vegas Valley Water Budget: Relationship of Distribution, Consumptive Use, and Recharge to Shallow Groundwater.
W79-02728 5G

CONTINENTAL SHELF
Emergency Suspension Procedures for Outer Continental Shelf Oil and Gas Operations,
W79-02532 5G

Baseline Report of Environmental Conditions in Deepwater Dumpsite 106. Vol I: Physical Characteristics.
W79-02622 5E

Baseline Report of Environmental Conditions in Deepwater Dumpsite 106. Volume II: Biological Characteristics.
W79-02623 5E

An Oilspill Risk Analysis for the Mid-Atlantic (Proposed Sale 49) Outer Continental Shelf Lease Area.
W79-02661 5G

Fine Structure Instabilities Induced by Double Diffusion in the Shelf/Slope Water Front,
W79-02851 2L

CONTROLLED DENITRIFICATION
Untersuchungen Zur Intensivhaltung Von Fischen Im Warm-Wasserkreislauf (Studies Regarding Intensified Fish Culture in a Closed Warm Water System),
W79-02896 5C

COOLING WATER
Probabilistic Analysis of Water Availability in Power Plant Site Selection,
W79-02834 3E

COPEPODS
Detritus as Food for Estuarine Copepods,
W79-02916 2L

COPPER
Concentrations of Ten Heavy Metals in Some Selected Lake Powell Game Fishes,
W79-02582 5B

Sensitivity of Macrocystis Gametophytes to Copper,
W79-02586 5C

Detoxification of Metals by Marine Bivalves: An Ultrastructural Study of the Compartmentation of Copper and Zinc in the Oyster Ostrea Edulis,
W79-02784 5A

Trace Metals in Some Fish Species of South Carolina,
W79-02887 5A

Actions Ecotoxicologiques de Certains Metaux (CU-ZN-PB-CD) Chez Les Poissons Dulcaquicoles De La Riviere Lot (The Ecotoxicological Action of some Metals (CU-ZN-PB-CD) on Freshwater Fish in the Lot River,
W79-02895 5C

The Detection of Heightened Sea-Water Copper Concentrations by the Mussel Mytilus Edulisl,
W79-02960 5A

Accelerated Rate of Albinism in Channel Catfish Exposed to Metals,
W79-02967 5C

CORN (FIELD)
Yield and Quality of Corn and Grain Sorghum Grain and Residues as Influenced by N Fertilization,
W79-02987 3F

CORPUS CHRISTI PASS (TEXAS)
Hydraulics and Dynamics of New Corpus Christi Pass, Texas: A Case History, 1972-73,
W79-02707 8B

CORRELATION ANALYSIS
Principal Components Analysis of Glacier-Climatological Data for Sentinel Glacier, British Columbia,
W79-02927 2C

CORROSION
Condition Survey-Asbestos-Bonded Steel Culverts in Western Oregon,
W79-02870 8G

Evaluation of the Corrosion Resistance of Alternate Revetment Wire Fabric Materials in the Lower Mississippi River,
W79-02872 8G

CORROSION CONTROL
Replacement of Metallic Impurities from Water by Metal Beds,
W79-02603 5F

Evaluation of the Corrosion Resistance of Alternate Revetment Wire Fabric Materials in the Lower Mississippi River,
W79-02872 8G

COST ANALYSIS
Financial Implications of Waste Management Systems for Shellfish Processing,
W79-02516 5G

Politics of Water Allocation, (Colorado River Basin),
W79-02735 6E

An Economic Analysis of Alternative Federal Flood Damage Assistance Programs.
W79-02824 6F

COST-BENEFIT ANALYSIS
Upgrading Dairy Production to Reduce Pollution -- Choosing the Optimum Financial Strategy for Pollution Control,
W79-02519 5G

COST REPAYMENT
Federal Guidelines: Industrial Cost Recovery Systems, Municipal Wastewater Treatment Works Construction Grants Program.
W79-02508 5G

COTTON
The Recovery of Leaf Water Potential, Transpiration, and Photosynthesis of Cotton During Irrigation Cycles,
W79-02990 2D

COTTONTAIL RABBIT
Parasites and Related Pathology of the Cottontail Rabbit (Sylvilagus floridanus) in central Pennsylvania,
W79-02833 5C

CROP PRODUCTION
Yield and Quality of Corn and Grain Sorghum Grain and Residues as Influenced by N Fertilization,
W79-02987 3F

Soybean Yields and Lance Nematode Populations as Affected by Subsoiling, Fertility, and Nematicide Treatments,
W79-02989 3F

CROP RESIDUES
Yield and Quality of Corn and Grain Sorghum Grain and Residues as Influenced by N Fertilization,
W79-02987 3F

CROP RESPONSE
Response Curves of Various Turfgrasses to Application of Several Controlled-Release Nitrogen Sources,
W79-02988 3F

Effect of Irrigation, Lime, and Fertility Treatments on the yield and Chemical Composition of Soybeans,
W79-02991 3F

Responses of Bermudagrass to Salinity,
W79-02993 3C

CRUDE OIL
Fate and Effects of Crude Oil Spilled on Permafrost Terrain. First Year Progress Report,
W79-02902 5B

CRUSTACEA
Osmotic Balance and Respiration in the Hermit Crab, Pagurus Bernhardus, Exposed to Fluctuating Salinities,
W79-02957 5C

CULTURAL PRACTICES
Resistances to Water Transport in Rice Plants,
W79-02986 2I

CULVERTS
Predicting Performance of Pipe Culverts Buried in Soil,
W79-02869 8D

Condition Survey-Asbestos-Bonded Steel Culverts in Western Oregon,
W79-02870 8G

CYANAZINE
Adsorption, Mobility and Degradation of Cyanazine and Diuron in Soils,
W79-02909 5B

CYANIDE
Evaluation of Proposed NPDES Limitations for Homestake Mining Company and Lead-Deadwood Sanitary District No. 1.
W79-02790 5G

CYANOPHATA
Effects of Salinity on Synthesis of DNA, Acidic Polysaccharide, and Growth in the Blue-Green Alga, Gomphosphaeria Aponina,
W79-02981 5C

CYCLING NUTRIENTS
An Overview of Nutrient Cycling Research at Coweeta Hydrologic Laboratory,
W79-02571 4D

Nutrient Budgets for Undisturbed and Manipulated Hardwood Forest Ecosystems in the Mountains of North Carolina,
W79-02574 4D

A Conceptual Ecological Model for Chesapeake Bay,
W79-02746 2L

DAIRY INDUSTRY
Upgrading Diary Production Facilities to Control Pollution -- In-Plant Control of Waste,
W79-02518 5G

Upgrading Dairy Production to Reduce Pollution -- Choosing the Optimum Financial Strategy for Pollution Control,
W79-02519 5G

DAM CONSTRUCTION
Concrete Placing Techniques Used During the Construction of the Krasnoiarsk Hydroelectric Power Plant,
W79-02691 8F

Specific Features of Construction of Thawed Soil Dams in Severe Climate Conditions,
W79-02693 8D

Dam of the Anadyrsk Thermal Electric Power Station,
W79-02862 8D

DAM DESIGN
Designing Concrete Dams for Especially Harsh Climatic Conditions,
W79-02864 8F

Dam Design and Construction in the USSR's North and Siberia,
W79-02868 8D

DAM FAILURE
Investigation of Slumping Failure in an Earth Dam Abutment at Kotzebue, Alaska,
W79-02702 8D

DAMS
The Effect of Hypolimnion Reservoir Releases on Fish Distribution and Species Diversity,
W79-02670 6G

Effect of Subzero Temperature in Concrete on the Nature of Operations of High Concrete Dams,
W79-02690 8F

DAMS

Evaluation of Stability of Earth-Fill Dam Based on Strength of Frozen Zones of its Profile,
W79-02696 8D

Studies of Nonstationary Temperature Regime of Frozen Dams Made of Local Materials on Permafrost Foundations.
W79-02698 8D

Engineerin Condition Survey and Structural investigation of Emsworth Locks and Dam, Ohio River,
W79-02706 8F

Development of a High Precision Capability for Monitoring Structural Movements of Locks and Dams,
W79-02708 8A

Condition Survey of Lock and Dam 3, Ohio River,
W79-02711 8F

Designing Concrete Dams for Especially Harsh Climatic Conditions,
W79-02864 8F

Cryopedological Research in the Construction of Dams Under Severe Climatic Conditions,
W79-02867 8D

Dam Design and Construction in the USSR's North and Siberia,
W79-02868 8D

Recommended Practice for the Design and Construction of Earth Dams for Industrial and Potable Water Supply in the Far North and Permafrost Areas.
W79-02871 8D

DAPHNIA

An Improved Experimental Medium for Freshwater Toxicity Studies Using Daphnia Magna,
W79-02972 5C

DATA COLLECTIONS

Suspended Sediment and Bed Material Studies on the Lower Mississippi River,
W79-02703 8B

Inventory of Interstate Carrier Water Supply Systems by States and Environmental Protection Agency Regions.
W79-02808 5G

Principal Components Analysis of Glacier-Climatological Data for Sentinel Glacier, British Columbia,
W79-02927 2C

DATA REQUIREMENTS

What the Design Engineer Needs from the Hydrometeorologist,
W79-02683 7C

DDE

Productivity of Ospreys in Connecticut-Long Island Increases as DDE Residue Declines,
W79-02886 5C

DDT

Microbial Degradation of Pesticides,
W79-02583 5

Chlorinated Pesticides and Heavy Metals in Streams and Lakes of Northern Mississippi Water,
W79-02900 5B

DECIDUOUS TREES

Nutrients, Toxins, and Water in Terrestrial and Aquatic Ecosystems Treated with Sewage Plant Effluents - Final Report of the Upland Recharge Program,
W79-02638 5D

DECOLORING

Colour and Toxicity Removal from Bleach Plant Effluents Using a Higgins Contactor,
W79-02953 5D

DECOMPOSING ORGANIC MATTER

The Relationship Between Net Primary Production and Accumulation for a Peatland in Southeastern Manitoba,
W79-02938 5C

DECONTAMINATION SOLUTION

Handbook for Pesticide Disposal by Common Chemical Methods,
W79-02806 5E

DEFICIENT ELEMENTS

Relations Between Soil Nutrients and Vegetation in Wetheaths. II. Nutrient Uptake by the Major Species in the Field and in Controlled Conditions,
W79-02939 2H

DEFORMATION

Results of In Situ Modulus of Deformation Test, Cannelton Lock and Dam,
W79-02710 8E

DEGRADATION

Evaluation of the MC-300A Soil Moisture Meter to Determine In-Place Moisture Content of Refuse at Land Disposal Sites,
W79-02503 5A

DEGRADATION (DECOMPOSITION)

The Accumulation, Translocation and Degradation of Biocides at Land Wastewater Disposal Sites: The Fate of Malathion, Carbaryl, Diazinon, and 2,4-D Butoxyethyl Ester,
W79-02890 5B

Adsorption, Mobility and Degradation of Cyanazine and Diuron in Soils,
W79-02909 5B

DEGRADATION (STREAM)

Nondeterioration and the Protection of High Quality Waters Under Federal Water Pollution Control Law.
W79-02547 5G

DELTAS

Rifting in the Okavango Delta,
W79-02934 2H

DENITRIFICATION

A Field Study of Treatment vs. Depth of Sand Fill in a Mound System,
W79-02604 5D

Denitrification in a Massachusetts Salt Marsh,
W79-02812 5A

DENSITY CURRENTS

A Note on the Circulation Induced by a Shallow-Sea Front,
W79-02688 2L

DENVER AREA (COLO)

Hydrologic Data for Urban Storm Runoff from Three Localities in the Denver Metropolitan Area, Colorado,
W79-02646 7C

DESALINATION

Integrating Desalination and Agricultural Salinity Control Alternatives,
W79-02629 5G

Development of a 50,000 GPD Seawater Reverse Osmosis Pilot Plant Based on Cellulose Triacetate Hollow Fine Fibers,
W79-02676 3A

DESALINATION PLANTS

Desalination Technology Transfer Center,
W79-02840 3A

DESIGN

Un Nouvel Aspirateur Sous-Marins A Air Comprime (A New Submarine Suction-Sampler, Using Compressed Air),
W79-02897 7B

Inexpensive Constant Water Level Device for Flow-Through Aquariums,
W79-02995 7B

DESIGN DATA

What the Design Engineer Needs from the Hydrometeorologist,
W79-02683 7C

DETERGENT

Banning Detergent Phosphates - The Debate Continues,
W79-02543 5G

DETOXIFICATION

Detoxification of Metals by Marine Bivalves: An Ultrastructural Study of the Compartmentation of Copper and Zinc in the Oyster Ostrea Edulis,
W79-02784 5A

Colour and Toxicity Removal from Bleach Plant Effluents Using a Higgins Contactor,
W79-02953 5D

DETRITUS

Detritus as Food for Estuarine Copepods,
W79-02916 2L

DEW

Dew-Monitoring Network in the Southeast,
W79-02853 7B

DEW-MONITORING NETWORK

Dew-Monitoring Network in the Southeast,
W79-02853 7B

DEWATERING

A High-Efficiency Thermal Drying System,
W79-02675 5E

DIATOMS

An Ecological Study of Epipsammic Diatoms from Sediments Associated with Juncus Roemerianus in a Northwest Florida Salt Marsh,
W79-02722 2L

Polychlorinated Biphenyls: Transfer from Microparticulates to Marine Phytoplankton and the Effects on Photosynthesis,
W79-02978 5C

The Presence of Pollutant Hydrocarbons in Estuarine Epipelic Diatom Populations,
W79-02998 5C

DICHLORAMINE

Analysis of Models for Dichloramine Removal by Activated Carbon in Batch and Packed-Bed Reactors Using Quasilinearization and Orthogonal Collocation Methods,
W79-02640 5D

DIELDRIN

Productivity of Ospreys in Connecticut-Long Island Increases as DDE Residue Declines,
W79-02886 5C

DIESEL FUEL

Benzo(A)Pyrene Monooxygenase Induction in Marine Fish -Molecular Response to Oil Pollution,
W79-02898 5C

DIFFUSION

Fine Structure Instabilities Induced by Double Diffusion in the Shelf/Slope Water Front,
W79-02851 2L

DIGESTERS
Anaerobic Digestion and Reverse Osmosis Separation for the Treatment of Domestic Liquid Waste,
W79-02826 5D

DIGITIZATION NOISE
Characteristics and Filtering of Noise in Linear Hydrological Systems,
W79-02914 7C

DILUTION
Dissolution Potential of Surficial Mancos Shale and Alluvium,
W79-02827 5B

DIOXIN
Fate of 2,3,7,8-Tetrachlorodibenzo-P-Dioxin (TCDD) in the Environment: Summary and Decontamination Recommendations,
W79-02639 5B

DIPTERA
Growth, Abundance and Distribution of Larval Tabanids in Experimentally Fertilized Plots on a Massachusetts Salt Marsh,
W79-02755 2L

DIQUAT
Toxicity of Selected Chemicals to the Fairy Shrimp, Streptocephalus Seali, Under Laboratory and Field Conditions,
W79-02971 5C

DISINFECTION
Electrochemical Biocide,
W79-02514 5D

Wastewater Disinfection in Canada,
W79-02935 5D

DISPERSION
Pollution Forecast in Streams,
W79-02831 5B

DISSOLVED ORGANIC PHOSPHORUS
Application of High Performance Liquid Chromatography to the Study of Dissolved Organic Phosphorus Compounds Released by Algae,
W79-02906 5A

Chromatographic Studies of Dissolved Organic Phosphorus Compounds Resulting from Algal Cultures,
W79-02907 5A

DISSOLVED OXYGEN
Dissolved-Oxygen Regimen of the Willamette River, Oregon, Under Conditions of Basinwide Secondary Treatment,
W79-02657 5G

Field Estimates of Aquatic Plant Respiration and its Application of Stream Dissolved Oxygen Budgets,
W79-02816 5C

Implementation and Evaluation of the Use of a Transient Flow Model in Assessing the Impact of Urban Stormwater Runoff on the Water Quality of the Tennessee River at Knoxville,
W79-02828 5B

Hatchery Alarm System to Protect Against Catastrophic Egg of Fish Kills,
W79-02977 5G

DISSOLVED OXYGEN ANALYZERS
Applicability of Existing Methods for the Determination of the Biochemical Oxygen Demand (BOD) of Incinerator Quench Water,
W79-02788 5A

DISSOLVED SOLIDS
Dissolution Potential of Surficial Mancos Shale and Alluvium,
W79-02827 5B

DISTRIBUTION
Las Vegas Valley Water Budget: Relationship of Distribution, Consumptive Use, and Recharge to Shallow Groundwater,
W79-02728 5G

Ecosystems of the World 1: Wet Coastal Ecosystems.
W79-02762 2L

Mangals and Salt Marshes of Eastern United States,
W79-02769 2L

DISTRIBUTION PATTERNS
Developmental and Environmental History of the Dismal Swamp,
W79-02751 2H

Introduction; Wet Coastal Ecosystems,
W79-02763 2L

Salt-Marsh Animals: Distributions Related to Tidal Flooding, Salinity and Vegetation,
W79-02767 2I

Plant and Animal Communities of Pacific North American Salt Marshes,
W79-02770 2L

Tidal Salt-Marsh and Mangal Formations of Middle and South America,
W79-02771 2L

Africa A. Wet Formations of the African Red Sea Coast,
W79-02772 2L

Africa B. The Remainder of Africa: Wet Coastal Ecosystems,
W79-02773 2L

Outlines of Ecology, Botany and Forestry of the Mangals of the Indian Subcontinent,
W79-02774 2L

Wet Coastal Formations of Indo-Malesia and Papua-New Guinea,
W79-02775 2L

Mangals of Micronesia, Taiwan, Japan, the Philippines and Oceania,
W79-02776 2L

Mangal and Coastal Salt-Marsh Communities in Australia,
W79-02777 2L

The Physical Environment and Bottom Fauna of a Bog Lake,
W79-02949 2H

DIURON
Adsorption, Mobility and Degradation of Cyanazine and Diuron in Soils,
W79-02909 5B

DIVERSION
A Procedure to Determine Direct Diversions from Lake Michigan,
W79-02523 3D

DIVERSITY INDEX
A Measure of Response to Perturbation Used to Assess Structural Change in some Polluted and Unpolluted Stream Fish Communities,
W79-02996 5B

DIVERSITY INDICES
Diversity as a Measure of Benthic Macroinvertebrate Community Response to Water Pollution,
W79-02595 5C

DNA
Effects of Salinity on Synthesis of DNA, Acidic Polysaccharide, and Growth in the Blue-Green Alga, Gomphosphaeria Aponina,
W79-02981 5C

DOMESTIC WATER
Hodges v. Oklahoma Water Resources Board (Water Resources Board Grant of Temporary Permit for Non-Domestic Groundwater Use Upheld).
W79-02557 6E

DRAINAGE BASINS
Preimpoundment Study Little Black Creek Drainage Basn Black Creek Watershed Bulloch County, Georgia,
W79-02635 5C

DRAINAGE EFFECTS
Biological Foundations of Forest Drainage Efficiency,
W79-02951 2I

DRAINAGE WELLS
Preliminary Appraisal of the Geohydrologic Aspects of Drainage Wells, Orlando Area, Central Florida,
W79-02656 4B

DREDGING
Effects of Channelization of the Luxapalila River on Fish, Aquatic Invertebrates, Water Quality and Furbearers,
W79-02636 5C

DRINKING WATER REGULATIONS
Some Impacts of Safe Drinking Water Standards on Rural Water Systems,
W79-02522 5G

DROUGHTS
California's Program for Dealing with the Drought,
W79-02544 6E

Water Conservation Information Dissemination During the 1977 Drought Emergency,
W79-02904 3B

DRY FARMING
Effect of Irrigation and Nitrogen on the Dry Matter and Crude Protein Yields of 'Pangola' Digitgrass,
W79-02992 3F

DRYERS
A High-Efficiency Thermal Drying System,
W79-02675 5E

DRYING
A High-Efficiency Thermal Drying System,
W79-02675 5E

DUG WELLS
Dug-Wells, Dug-Cum-Bore Wells, and Tubewells,
W79-02994 4B

DYLOX
Toxicity of Selected Chemicals to the Fairy Shrimp, Streptocephalus Seali, Under Laboratory and Field Conditions,
W79-02971 5C

EARTH DAMS
Specific Features of Construction of Thawed Soil Dams in Severe Climate Conditions,
W79-02693 8D

Thermal Regime of Earth-Rock Dams Constructed in the Far North,
W79-02694 8D

Fundamentals of Constructing Frozen Type Earth Dams in the Arctic,
W79-02695 8D

Evaluation of Stability of Earth-Fill Dam Based on Strength of Frozen Zones of its Profile,
W79-02696 8D

Investigation of Slumping Failure in an Earth Dam Abutment at Kotzebue, Alaska,
W79-02702 8D

Analytical Computation of the Three-Dimensional Steady-State Temperature Condition of a Dam,
W79-02856 8D

Dam of the Anadyrsk Thermal Electric Power Station,
W79-02862 8D

Cryopedological Research in the Construction of Dams Under Severe Climatic Conditions,
W79-02867 8D

Dam Design and Construction in the USSR's North and Siberia,
W79-02868 8D

Recommended Practice for the Design and Construction of Earth Dams for Industrial and Potable Water Supply in the Far North and Permafrost Areas.
W79-02871 8D

Analysis of Consolidation of Earth and Rockfill Dams, Volume I, Main Text and Appendices A and B,
W79-02875 8D

EAST HIGHLANDS
Distribution of Dissolved Nitrate and Fluoride in Ground Water, Highland-East Highlands, San Bernardino County, California,
W79-02663 5B

ECOLOGICAL DISTRIBUTION
Environmental Factors Limiting the Distribution of Five Plant Species on Salt Marshes of Island Beach, New Jersey,
W79-02678 2L

Studies on the Ecology of a Streamside Forest: Composition and Distribution of Vegetation Beneath the Tree Canopy,
W79-02752 2I

ECOLOGY
Ecological Effects of an Artificial Island, Rincon Island Punta Gorda, California,
W79-02614 6G

ECONOMIC EFFICIENCY
Linear Programming Model to Quantify Economic, Environmental and Social Values of a Tidal Marsh,
W79-02723 6B

ECONOMIC JUSTIFICATION
Economic Incentives for Institutional Change: The Case of the Virginia Wetlands Act,
W79-02721 6E

ECONOMICS
Exploitation of Mangal,
W79-02778 2L

Human Uses of Salt Marshes,
W79-02779 2L

ECOSYSTEMS
Trophic Interactions.
W79-02610 5C

Solution of Coupled Nonlinear Ecosystem Equations,
W79-02714 2L

ECOTYPES
Photosynthetic Properties and Root Chilling Responses of Altitudinal Ecotypes of Typha Latifolia L.,
W79-02940 2I

EDUCATION
Program Implementation Procedures: Implementation of Two Year Post High School Wastewater Technology Instructional Programs.
W79-02789 5G

EFFECTS
New Considerations for Municipal Water System Planning,
W79-02729 6B

EFFLUENT QUALITY
Owens-Corning Fiberglass Corporation Wastewater Treatment Facility, Anderson, South Carolina, Technical Support Project March-May 1973.
W79-02796 5D

EFFLUENT SPRAYING
Avian Communities and Habitat Components in Natural and Wastewater-Irrigated Environments,
W79-02601 5G

EFFLUENTS
Upgrading Textile Operations to Reduce Pollution, Volume 1: In-Plant Control of Pollution.
W79-02504 5D

Niagra of Wisconsin Paper Corp. v. Wisconsin Dept. of Natural Resources (State Effluent Discharge Permits must be Modified in Accordance with State Law to Comply with EPA Standards.
W79-02560 6E

Volatile Chloro- and Bromocarbons in Coastal Waters,
W79-02684 5B

Les Oligochetes D'un Cours D'eau Montagnard Pollue: Le Bief Rouge (The Oligochaetes of a Polluted Mountain Stream: The Bief Rouge),
W79-02893 5C

ELECTRIC FISHING GEAR
Lethality of Electroshock to Two Freshwater Fishes,
W79-02969 5C

ELECTRIC SHOCKING
Lethality of Electroshock to Two Freshwater Fishes,
W79-02969 5C

ELECTRIC SHOCKING GEAR
Physiological Effects of Electrofishing on Largemouth Bass,
W79-02968 5C

ELECTRO-FISHING
Physiological Effects of Electrofishing on Largemouth Bass,
W79-02968 5C

Lethality of Electroshock to Two Freshwater Fishes,
W79-02969 5C

ELECTROCHEMISTRY
Replacement of Metallic Impurities from Water by Metal Beds,
W79-02603 5F

ELECTRON MICROSCOPY
Detoxification of Metals by Marine Bivalves: An Ultrastructural Study of the Compartmentation of Copper and Zinc in the Oyster Ostrea Edulis.
W79-02784 5A

EMSWORTH LOCKS AND DAM (OHIO RIVER)
Engineerin Condition Survey and Structural investigation of Emsworth Locks and Dam, Ohio River,
W79-02706 8F

ENERGY
Social Overhead Capital Costs of Irrigation Development in Washington State,
W79-02719 3F

Resource Demands for Energy Development in the Yellowstone River Basin,
W79-02726 6D

Energy Resources Development, (Colorado River Basin),
W79-02737 3E

ENERGY TRANSFER
Energy Flux in a Tidal Creek Draining an Irregularly Flooded Juncus Marsh,
W79-02748 2L

ENGLISH CHANNEL
Seasonal Phytoplankton Production in the Western English Channel 1964-1974,
W79-02963 5C

ENTERIC VIRUSES
Stability of Human Enteroviruses in Estuarine and Marine Waters,
W79-02803 5B

ENTEROVIRUSES
An Assessment of the Occurrence of Human Viruses in Long Island Aquatic Systems,
W79-02584 5C

ENVIRONMENTAL ASSESSMENT
Species, Habitats and Processes Sensitive to OCS Development,
W79-02609 5C

ENVIRONMENTAL CONTROL
Laws Passed During the 1976 Session of the Mississippi Legislature (concerning Maine and Coastal Zone),
W79-02526 6E

ENVIRONMENTAL EFFECTS
Environmental Assessment of the Alaskan Continental Shelf. Interim Synthesis: Beaufort/Chukchi.
W79-02608 5C

Species, Habitats and Processes Sensitive to OCS Development,
W79-02609 5C

Trophic Interactions.
W79-02610 5C

Effects of Gravel Mining and Construction of Gravel Islands and Causeways.
W79-02612 5C

Ecological Effects of an Artificial Island, Rincon Island Punta Gorda, California.

FERTILIZATION
Yield and Quality of Corn and Grain Sorghum Grain and Residues as Influenced by N Fertilization,
W79-02987 3F

Effect of Irrigation, Lime, and Fertility Treatments on the yield and Chemical Composition of Soybeans,
W79-02991 3F

Effect of Irrigation and Nitrogen on the Dry Matter and Crude Protein Yields of 'Pangola' Digitgrass,
W79-02992 3F

FERTILIZERS
Yield and Quality of Corn and Grain Sorghum Grain and Residues as Influenced by N Fertilization,
W79-02987 3F

Response Curves of Various Turfgrasses to Application of Several Controlled-Release Nitrogen Sources,
W79-02988 3F

FINANCING
Shore Erosion Control.
W79-02565 6E

FINITE-DIFFERENCE MODEL
Unsteady Streamflow Simulation Using a Linear Implicit Finite-Difference Model,
W79-02644 2E

FINITE ELEMENT ANALYSIS
A Three-Dimensional Galerkin Finite Element Model for the Analysis of Contaminant Transport in Variably Saturated Porous Media, User's Guide,
W79-02838 5B

FISH
Methodology Developed for Assessment of Fish and Macroinvertebrate Communities in the New River, Virginia,
W79-02606 5C

Problem Definition Studies on Potential Environmental Pollutants, IV: Physical, Chemical, Toxicological, and Biological Properties of Benzene; Toluene; Xylenes; and P-Chlorophenyl Methyl Sulfide, Sulfoxide, and Sulfone.
W79-02637 5G

Effects of Grass Carp Introduction on Macrophytic Vegetation and Chlorophyll Content of Phytoplankton in Four Florida Lakes,
W79-02758 2H

FISH BEHAVIOR
The Potential and Realized Influences of Temperature on the Distribution of Fishes in the New River, Glen Lyn, Virginia,
W79-02903 5C

FISH DIETS
Age, Growth, and Food Habits of the Fathead Minnow, Pimephales Promelas, in North Dakota Saline Lakes,
W79-02590 2H

FISH DISEASES
Microbiological Considerations of Ozone Treatment of Reuse Water in Fish Hatcheries,
W79-02823 5D

FISH FARMING
Exploitation of Mangal,
W79-02778 2L

Discharge of Solids from Fish Ponds,
W79-02970 5B

FISH HATCHERIES
The Use of Potassium Permanganate (KMNO4) in Fisheries; A Literature Review,
W79-02585 5G

Discharge of Solids from Fish Ponds,
W79-02970 5B

FISH KILLS
Hatchery Alarm System to Protect Against Catastrophic Egg of Fish Kills,
W79-02977 5G

FISH MIGRATION
Effects of Reduced Nighttime Flow on Upstream Migration of Adult Chinook Salmon and Steelhead Trout in the Lower Snake River,
W79-02919 8I

FISH PASSAGES
Effects of Reduced Nighttime Flow on Upstream Migration of Adult Chinook Salmon and Steelhead Trout in the Lower Snake River,
W79-02919 8I

FISH PATHOGENS
Microbiological Considerations of Ozone Treatment of Reuse Water in Fish Hatcheries,
W79-02823 5D

FISH PHYSIOLOGY
Trace Metals in Some Fish Species of South Carolina,
W79-02887 5A

The Potential and Realized Influences of Temperature on the Distribution of Fishes in the New River, Glen Lyn, Virginia,
W79-02903 5C

FISH POPULATIONS
The Effect of Hypolimnion Reservoir Releases on Fish Distribution and Species Diversity,
W79-02670 6G

Technique for Collecting Fish with a Block Net in a Pumped Storage Reservoir,
W79-02976 7B

FISH REPRODUCTION
Age, Growth, and Food Habits of the Fathead Minnow, Pimephales Promelas, in North Dakota Saline Lakes,
W79-02590 2H

Effects of Temperature on Hatching Success and Survival of Larvae in the White Bass,
W79-02965 5C

FISH TYPES
Assessment and Implementation of In-Stream Value Studies for the Northern Great Plains,
W79-02709 4A

FISHERIES MANAGEMENT
Effects of Water Drawdown on the Fauna in Small Cold-Water Reservoirs,
W79-02830 4A

FISHING
Technique for Collecting Fish with a Block Net in a Pumped Storage Reservoir,
W79-02976 7B

FISHKILL
Evaluation of Proposed NPDES Limitations for Homestake Mining Company and Lead-Deadwood Sanitary District No. 1.
W79-02790 5G

FISHTRAP DAM (KY)
Potential Alkali-Carbonate Rock Reactivity of Some of the Aggregate Used in Fishtrap Dam,
W79-02705 8F

FLAGFISH
Sublethal Effects of Treated Liquid Effluent from a Petroleum Refinery on Freshwater Organisms,
W79-02929 5C

FLOCCULATION
Polymer Coagulation of Humic Acid Waters,
W79-02715 5D

FLOOD CONTROL
Control of 1973 Mississippi River Flood,
W79-02717 4A

FLOOD DAMAGE
Butts v. City of South Fulton (Construction of Road which Interfered with Natural Drainage and Caused Flooding Constituted Actionable Nuisance).
W79-02558 6E

An Economic Analysis of Alternative Federal Flood Damage Assistance Programs.
W79-02824 6F

FLOOD FREQUENCY
Methods for Estimating the Magnitude and Frequency of Floods in Arizona,
W79-02649 2E

Studies on the Ecology of a Streamside Forest: Composition and Distribution of Vegetation Beneath the Tree Canopy,
W79-02752 2I

FLOOD INDICES
The Development of Flood-Potential Index Maps for Pennsylvania,
W79-02598 4A

FLOOD INSURANCE PROGRAMS
An Economic Analysis of Alternative Federal Flood Damage Assistance Programs.
W79-02824 6F

FLOOD PEAK
The Development of Flood-Potential Index Maps for Pennsylvania,
W79-02598 4A

Methods for Estimating the Magnitude and Frequency of Floods in Arizona,
W79-02649 2E

FLOOD PLAIN
Plant Biomass and Net Primary Production Along a Flood-Frequency Gradient in the Streamside Forest,
W79-02761 2I

FLOOD PLAINS
Studies on the Ecology of a Streamside Forest: Composition and Distribution of Vegetation Beneath the Tree Canopy,
W79-02752 2I

Notes on the Flora of the Congaree River Floodplain, Richland County, South Carolina.
W79-02756 2I

FLOOD POTENTIAL
The Development of Flood-Potential Index Maps for Pennsylvania,
W79-02598 4A

FLOODING
The Development of Flood-Potential Index Maps for Pennsylvania,
W79-02598 4A

FLOODS
A Rainfall-Runoff Modeling Procedure for Improving Estimates of T-Year (Annual) Floods for Small Drainage Basins,
W79-02652 2E

FLORIDA
Rules and Procedures for Application for Coastal Construction Permits.
W79-02559 6E

Effects of Bottom Sediments on Infiltration from the Miami and Tributary Canals to the Biscayne Aquifer, Dade County, Florida,
W79-02653 5B

Preliminary Evaluation of the Water-Supply Potential of the Spring-River System in Weeki Wachee Area and the Lower Withlacoochee River, West-Central Florida.
W79-02655 4B

Preliminary Appraisal of the Geohydrologic Aspects of Drainage Wells, Orlando Area, Central Florida,
W79-02656 4B

Feasibility of Water-Supply Development from the Unconfined Aquifer in Charlotte County, Florida,
W79-02662 4B

Preliminary Hydrologic Budget of the Sand-and-Gravel Aquifer Under Unstressed Conditions, with a Section on Water-Quality Monitoring, Pensacola, Florida.
W79-02664 5B

Water Wetlands, and Wood Storks in Southwest Florida,
W79-02677 2H

Habitat and Successional Changes of the Atlantic Coastal Ridge of Palm Beach County, Florida,
W79-02713 2I

An Ecological Study of Epipsammic Diatoms from Sediments Associated with Juncus Roemerianus in a Northwest Florida Salt Marsh,
W79-02722 2L

Surface Water Resources of Northwest Florida,
W79-02727 2E

Nesting Wading Bird Populations in Southern Florida,
W79-02753 2I

Soils of the Inter-Tidal Marshes of Dixie County, Florida,
W79-02757 2G

Effects of Grass Carp Introduction on Macrophytic Vegetation and Chlorophyll Content of Phytoplankton in Four Florida Lakes,
W79-02758 2H

Dew-Monitoring Network in the Southeast,
W79-02853 7B

FLORIDAN AQUIFER
Preliminary Appraisal of the Geohydrologic Aspects of Drainage Wells, Orlando Area, Central Florida,
W79-02656 4B

FLOW
Linear Ground-Water Flow, Flood-Wave Response Program for Programmable Calculators,
W79-02651 2F

FLOW CONTROL
Transit Losses and Traveltimes of Reservoir Releases along the Arkansas River from Pueblo Reservoir to John Martin Reservoir, Southeastern Colorado,
W79-02659 4A

FLOW-THROUGH AQUARIA
Inexpensive Constant Water Level Device for Flow-Through Aquariums,
W79-02995 7B

FLUCTUATING
Osmotic Balance and Respiration in the Hermit Crab, Pagurus Bernhardus, Exposed to Fluctuating Salinities,
W79-02957 5C

FLUCTUATIONS
Correlations of Fish Catch and Environmental Factors in the Gulf of Maine,
W79-02997 2L

FLUORIDES
Distribution of Dissolved Nitrate and Fluoride in Ground Water, Highland-East Highlands, San Bernardino County, California,
W79-02663 5B

FLUOROMETRY
Microfluorometric Method to Measure Ammonium in Natural Waters,
W79-02847 2K

FOLIAGE HEIGHT DIVERSITY
Avian Communities and Habitat Components in Natural and Wastewater-Irrigated Environments,
W79-02601 5G

FOOD CHAINS
Selenium Metabolism in the Marine Phytoplankters Tetraselmis Tetrathele and Dunaliella Minuta,
W79-02979 5C

FOOD HABITS
Environmental Studies of Kachemak Bay and Lower Cook Inlet, Volume VI: Food Habits of Shrimp in Kachemak Bay, Alaska,
W79-02780 2L

FOOD PROCESSING INDUSTRY
Chitosan -- A Polymer from Seafood Waste, for use in Treatment of Food Processing Wastes and Activated Sludge,
W79-02513 5D

FOOD WEBS
Biological Availability of Pollutants to Marine Organisms,
W79-02628 5C

FORAGE GRASSES
Effect of Irrigation and Nitrogen on the Dry Matter and Crude Protein Yields of 'Pangola' Digitgrass,
W79-02992 3F

FORECASTING
Developing Procedures for Predicting Effectiveness in Seepage Control,
W79-02820 4A

Pollution Forecast in Streams,
W79-02831 5B

Probabilistic Analysis of Water Availability in Power Plant Site Selection,
W79-02834 3E

FOREST MANAGEMENT
Forest Service Studies of Soil and Nutrient Losses Caused by Roads, Logging, Mechanical Site Preparation, and Prescribed Burning in the Southeast,
W79-02572 5B

FORESTRY PRACTICES
Nutrient Budgets for Undisturbed and Manipulated Hardwood Forest Ecosystems in the Mountains of North Carolina,
W79-02574 4D

FORESTS
Studies on the Ecology of a Streamside Forest: Composition and Distribution of Vegetation Beneath the Tree Canopy,
W79-02752 2I

FORMALIN
Toxicity of Selected Chemicals to the Fairy Shrimp, Streptocephalus Seali, Under Laboratory and Field Conditions,
W79-02971 5C

FRAGIPAN
Root Growth in Cores Formed from Fragipan and B2 Horizons of Hobson Soil,
W79-02592 2G

FRAINS LAKE (MICH)
Seiche Structure and Vertical Mixing Below the Epilimnion in Small Lakes,
W79-02813 5C

FRESHWATER
Spears v. Berle (Wetlands Property Use Restrictions not a Faking When Serving a Public Purpose).
W79-02570 6E

FRESHWATER FISH
Actions Ecotoxicologiques de Certains Metaux (CU-ZN-PB-CD) Chez Les Poissons Dulcaquicoles De La Riviere Lot (The Ecotoxicological Action of some Metals (CU-ZN-PB-CD) on Freshwater Fish in the Lot River,
W79-02895 5C

Technique for Collecting Fish with a Block Net in a Pumped Storage Reservoir,
W79-02976 7B

FRESHWATER FISHES
Concentrations of Ten Heavy Metals in Some Selected Lake Powell Game Fishes,
W79-02582 5B

FRESHWATER MARSHES
The Seed Banks of Prairie Glacial Marshes,
W79-02933 2I

Rifting in the Okavango Delta,
W79-02934 2H

Assessment of the Physical and Biological Characteristics of the Major Lake Champlain Wetlands,
W79-02937 2H

FROZEN SOILS
Fundamentals of Constructing Frozen Type Earth Dams in the Arctic,
W79-02695 8D

FROZEN TYPE DAMS
Fundamentals of Constructing Frozen Type Earth Dams in the Arctic,
W79-02695 8D

FUNGI
Microbial Degradation of Pesticides,
W79-02583 5

FUNGICIDES
Detection of Water Pollutants by Laser Excited Resonance Raman Spectroscopy; Pesticides and Fungicides,
W79-02576 5A

GENETICS
The Genetic Basis of the Ecological Amplitude of Spartina Patens on the Outer Banks of North Carolina,
W79-02669 2L

GEOGRAPHICAL REGIONS
Ecosystems of the World 1: Wet Coastal Ecosystems.
W79-02762 2L

Introduction; Wet Coastal Ecosystems,
W79-02763 2L

GEOMORPHOLOGY
Physiography; Wet Coastal Ecosystems,
W79-02764 2L

Rifting in the Okavango Delta,
W79-02934 2H

GEORGIA
Preimpoundment Study Little Black Creek Drainage Basn Black Creek Watershed Bulloch County, Georgia,
W79-02635 5C

Impact of Flow Regulation and Power Plant Effluents on the Flow and Temperature Regimes of the Chattahochee River -- Atlanta to Whitesburg, Georgia,
W79-02648 5B

Biological Productivity in Two Georgia River Swamps,
W79-02720 2H

Dew-Monitoring Network in the Southeast,
W79-02853 7B

Pools of Nitrogen in a Georgia Salt Marsh,
W79-02899 5C

GEORGIAN BAY
Chemical Limnology of Georgian Bay, 1974,
W79-02923 5A

GLACIERS
Glacier Surveys in Alberta - 1975,
W79-02925 2C

Principal Components Analysis of Glacier-Climatological Data for Sentinel Glacier, British Columbia,
W79-02927 2C

GRAIN SORGHUM
Yield and Quality of Corn and Grain Sorghum Grain and Residues as Influenced by N Fertilization,
W79-02987 3F

GRAND VALLEY (COLO)
'Best Management Practices' for Salinity Control in Grand Valley,
W79-02521 5G

Evaluation of Irrigation Methods for Salinity Control in Grand Valley,
W79-02594 5G

GRASS CARP
Effects of Grass Carp Introduction on Macrophytic Vegetation and Chlorophyll Content of Phytoplankton in Four Florida Lakes,
W79-02758 2H

GRASSES
Effect of Irrigation and Nitrogen on the Dry Matter and Crude Protein Yields of 'Pangola' Digitgrass,
W79-02992 3F

GRAVITY SURVEYS
Analysis of Gravity Data from the Picacho Basin, Pinal County, Arizona,
W79-02599 7C

GRAZING
Cattle, Wildlife, and Riparian Habitats in the Western Dakotas,
W79-02760 2I

GREAT BARRIER REEF
High-Magnesium Calcite Ooids from the Great Barrier Reef,
W79-02999 2L

GREAT LAKES
Satellite Observations of Calcium Carbonate Precipitations in the Great Lakes,
W79-02685 7B

GREAT LAKES REGION
Banning Detergent Phosphates - The Debate Continues,
W79-02543 5G

GREAT PLAINS
Cattle, Wildlife, and Riparian Habitats in the Western Dakotas,
W79-02760 2I

GREAT SALT LAKE (UTAH)
A Chemical Model of Heavy Metals in the Great Salt Lake,
W79-02913 5B

GREAT SIPPEWISSETT MARSH (MASS)
Growth, Abundance and Distribution of Larval Tabanids in Experimentally Fertilized Plots on a Massachusetts Salt Marsh,
W79-02755 2L

GROUNDWATE
Water Resources Data for Oklahoma, Water Year 1977--Volume 2. Red River Basin.
W79-02665 7C

GROUNDWATER
The Contamination of Groundwater by Heavy Metals from the Land Disposal of Fly Ash,
W79-02507 5B

Overview of Federal Groundwater Protection Legislation Aids Environmentalists,
W79-02546 5G

Selected Hydrologic Data, 1931-77, Wasatch Plateau-Book Cliffs Coal-Fields Area, Utah,
W79-02645 7C

Estimated Agricultural Ground-Water Pumpage in Parts of Fresno, Kings, and Madera Counties, San Joaquin Valley, California, 1974-77,
W79-02658 4B

Distribution of Dissolved Nitrate and Fluoride in Ground Water, Highland-East Highlands, San Bernardino County, California,
W79-02663 5B

Water Resources Data for Arkansas, Water Year 1977.
W79-02666 7C

Water Resources Data for Oklahoma, Water Year 1977--Volume 1. Arkansas River Basin
W79-02667 7C

Water Resources Data for West Virginia, Water Year 1977.
W79-02668 7C

N15/N14 Ratios of Ground-Water Nitrate, Long Island, New York,
W79-02689 5B

Chemical Treatment for Organic Color Removal from Groundwaters,
W79-02782 5D

Nicomekl-Serpentine Basin Study, British Columbia,
W79-02785 4B

Use of Neutron Activatable Tracers for Simulating Water and Chemical Flow Through Porous Media,
W79-02814 5B

Interaction Between Landfill Leachates and Carbonate-Derived Residual Soils,
W79-02829 5B

Well Field Site Selection Based on Geologic Criteria that Influence Ground Water Circulation in the Vicinity of Laramie, Wyoming,
W79-02912 4B

GROUNDWATER FLOW
A Three-Dimensional Galerkin Finite Element Model for the Analysis of Contaminant Transport in Variably Saturated Porous Media, User's Guide,
W79-02838 5B

GROUNDWATER MODELS
Uncertainties of Karstic Water Resources Systems,
W79-02883 2F

GROUNDWATER MOVEMENT
Linear Ground-Water Flow, Flood-Wave Response Program for Programmable Calculators,
W79-02651 2F

GROUNDWATER RECHARGE
Effects of Bottom Sediments on Infilration from the Miami and Tributary Canals to the Biscayne Aquifer, Dade County, Florida,
W79-02653 5B

Preliminary Appraisal of the Geohydrologic Aspects of Drainage Wells, Orlando Area, Central Florida,
W79-02656 4B

Las Vegas Valley Water Budget: Relationship of Distribution, Consumptive Use, and Recharge to Shallow Groundwater,
W79-02728 5G

GROUNDWATER RESOURCE
Peterson v. Ground Water Commission (Evidence of Overappropriated Ground Water Resources Sufficient to Deny Well Construction Permit Application).
W79-02568 6E

GROUNDWATER RESOURCES
Overview of Federal Groundwater Protection Legislation Aids Environmentalists,
W79-02546 5G

Water Wells and Springs in Palo Verde Valley, Riverside and Imperial Counties, California,
W79-02647 7C

Groundwater in the Newberg Area, Northern Willamette Valley, Oregon,
W79-02650 2F

Feasibility of Water-Supply Development from the Unconfined Aquifer in Charlotte County, Florida,
W79-02662 4B

GROUTING
Spray Grouting: Summary of Research, Development, Utilization, and Future Uses,
W79-02863 8F

GROWTH
Effects of Temperature on Growth Constants of Selenastrum Capricortnutum,
W79-02876 5C

GROWTH RATES
The Effects of Three Phthalate Esters on the Larval Development of the Grass Shrimp Palaemonetes Pugio (Holthuis),
W79-02786 5C

Investigation of a Nutrient-Growth Model Using a Continuous Culture of Natural Phytoplankton,
W79-02962 5C

GROWTH STAGES
The Effects of Three Phthalate Esters on the Larval Development of the Grass Shrimp Palaemonetes Pugio (Holthuis),
W79-02786 5C

GULF COAST
Preliminary Evaluation of the Water-Supply Potential of the Spring-River System in Weeki Wachee Area and the Lower Withlacoochee River, West-Central Florida.
W79-02655 4B

GULF COASTAL PLAIN
Tidal Salt-Marsh and Mangal Formations of Middle and South America,
W79-02771 2L

GULF OF MAINE
Correlations of Fish Catch and Environmental Factors in the Gulf of Maine,
W79-02997 2L

GULF OF MEXICO
Hydraulics and Dynamics of New Corpus Christi Pass, Texas: A Case History, 1972-73,
W79-02707 8B

HABITATS
Probable Impacts and Consequences of Oil Development,
W79-02611 5C

Cattle, Wildlife, and Riparian Habitats in the Western Dakotas,
W79-02760 2I

HALOFORMS
Volatile Chloro- and Bromocarbons in Coastal Waters,
W79-02684 5B

HALOGENS
Use of Neutron Activatable Tracers for Simulating Water and Chemical Flow Through Porous Media,
W79-02814 5B

HALOPHYTES
Plant and Animal Communities of Pacific North American Salt Marshes,
W79-02770 2L

HATCHERY ALARM SYSTEMS
Hatchery Alarm System to Protect Against Catastrophic Egg of Fish Kills,
W79-02977 5G

HAWAII
Solution of Coupled Nonlinear Ecosystem Equations,
W79-02714 2L

HAZARDOUS WASTES
Residual Management by Land Disposal, Proceedings of the Hazardous Waste Research Symposium.
W79-02810 5E

HAZARDS
Environmental Hazards to Offshore Operations.
W79-02613 5C

An Oilspill Risk Analysis for the Mid-Atlantic (Proposed Sale 49) Outer Continental Shelf Lease Area,
W79-02661 5G

HEAT BUDGET
The Role of Ice and Snow in Lake Heat Budgets,
W79-02844 2H

HEAT FLOW
Impact of Flow Regulation and Power Plant Effluents on the Flow and Temperature Regimes of the Chattahochee River -- Atlanta to Whitesburg, Georgia,
W79-02648 5B

HEAVY METALS
The Contamination of Groundwater by Heavy Metals from the Land Disposal of Fly Ash,
W79-02507 5B

Replacement of Metallic Impurities from Water by Metal Beds,
W79-02603 5F

Biological Availability of Pollutants to Marine Organisms,
W79-02628 5C

A Chemical Model of Heavy Metals in the Great Salt Lake,
W79-02913 5B

HELMINTH INFECTION
Parasites and Related Pathology of the Cottontail Rabbit (Sylvilagus floridanus) in central Pennsylvania,
W79-02833 5C

HERBICIDES
Fate of 2,3,7,8-Tetrachlorodibenzo-P-Dioxin (TCDD) in the Environment: Summary and Decontamination Recommendations,
W79-02639 5B

Adsorption, Mobility and Degradation of Cyanazine and Diuron in Soils,
W79-02909 5B

Atrazine Persistence in a Valentine Loamy Fine Sand Profile,
W79-02910 5A

Plant Competition for Atrazine,
W79-02985 5A

HISTOCHEMISTRY
Use of Histologic and Histochemical Assessments in the Prognosis of the Effects of Aquatic Pollutants,
W79-02877 5C

HISTOLOGY
Use of Histologic and Histochemical Assessments in the Prognosis of the Effects of Aquatic Pollutants,
W79-02877 5C

HISTORY
Colorado River Development, (Colorado River Basin),
W79-02734 6E

Policy Goals and Values in Historical Perspective, (Colorado River Basin),
W79-02736 6B

Historical Land Use Changes and Impacts in Lake Champlain Wetlands (1941/42, 1962, 1974),
W79-02750 4C

Developmental and Environmental History of the Dismal Swamp,
W79-02751 2H

HOBSON SOIL
Root Growth in Cores Formed from Fragipan and B2 Horizons of Hobson Soil,
W79-02592 2G

HUMAN RESOURCES
Carrying Capacity and Planning, (Colorado River Basin),
W79-02741 6B

HUMIC ACIDS
Chemical Treatment for Organic Color Removal from Groundwaters,
W79-02782 5D

HYDRAULIC CONDUCTIVITY
Prediction of Hydraulic Conductivity Changes Using Soil Characteristics,
W79-02600 2G

Use of Neutron Activatable Tracers for Simulating Water and Chemical Flow Through Porous Media,
W79-02814 5B

Developing Procedures for Predicting Effectiveness in Seepage Control,
W79-02820 4A

Investigation of Natural Sealing Processes in Irrigation Canals and Reservoirs,
W79-02905 4A

HYDRAULIC PROPERTIES
Empirical Equations for Some Soil Hydraulic Properties,
W79-02679 2G

HYDRAULIC STRUCTURES
Recommended Practice for the Design and Construction of Earth Dams for Industrial and Potable Water Supply in the Far North and Permafrost Areas.
W79-02871 8D

HYDRODYNAMICS
Hydrodynamic Transport Phenomena in Estuaries and Coastal Waters. Scope of Mathematical models,
W79-02983 2L

HYDROGEN ION CONCENTRATION
pH Fluctuation in an Intertidal Beach in Bermuda,
W79-02842 2L

HYDROGEOLOGY
Preliminary Appraisal of the Geohydrologic Aspects of Drainage Wells, Orlando Area, Central Florida,
W79-02656 4B

Feasibility of Water-Supply Development from the Unconfined Aquifer in Charlotte County, Florida,
W79-02662 4B

Preliminary Hydrologic Budget of the Sand-and-Gravel Aquifer Under Unstressed Conditions, with a Section on Water-Quality Monitoring, Pensacola, Florida,
W79-02664 5B

An Appraisal of the Hydrogeological Processes Involved in Shallow Subsurface Radioactive Waste Management in Canadian Terrain,
W79-02926 5B

HYDROGRAPH ANALYSIS
Peterson v. Ground Water Commission (Evidence of Overappropriated Ground Water Resources Sufficient to Deny Well Construction Permit Application).
W79-02568 6E

HYDROLOGIC DATA
Water Resources Data for Oklahoma, Water Year 1977--Volume 2. Red River Basin.
W79-02665 7C

Water Resources Data for Arkansas, Water Year 1977.
W79-02666 7C

Water Resources Data for Oklahoma, Water Year 1977--Volume 1. Arkansas River Basin.
W79-02667 7C

Water Resources Data for West Virginia, Water Year 1977.
W79-02668 7C

What the Design Engineer Needs from the Hydrometeorologist,
W79-02683 7C

HYDROLOGIC SYSTEMS
Characteristics and Filtering of Noise in Linear Hydrological Systems,
W79-02914 7C

ICE
Studies of Nonstationary Temperature Regime of Frozen Dams Made of Local Materials on Permafrost Foundations.
W79-02698 8D

A New Method for Collecting Water Samples from Beneath the Ice,
W79-02845 7B

Preferred Crystal Orientations in the Fast Ice Along the Margins of the Arctic Ocean,
W79-02850 2C

An Investigation of Ice Forces on Vertical Structures,
W79-02865 2C

ICE COVER
Assessment and Implementation of In-Stream Value Studies for the Northern Great Plains,
W79-02709 4A

ICE LOADS
An Investigation of Ice Forces on Vertical Structures,
W79-02865 2C

IDAHO
A Program to Promote Irrigation Conservation in Idaho,
W79-02671 3F

Optimizing Irrigation System Design,
W79-02672 3F

Effects of Reduced Nighttime Flow on Upstream Migration of Adult Chinook Salmon and Steelhead Trout in the Lower Snake River,
W79-02919 8I

ILLINOIS
A Procedure to Determine Direct Diversions from Lake Michigan,
W79-02523 3D

Water Quality in the Sugar Creek Basin, Bloomington and Normal, Illinois.
W79-02660 5B

Studies on the Ecology of a Streamside Forest: Composition and Distribution of Vegetation Beneath the Tree Canopy,
W79-02752 2I

Plant Biomass and Net Primary Production Along a Flood-Frequency Gradient in the Streamside Forest,
W79-02761 2I

ILLINOIS BASIN (ILL)
Fossil Plants and Coal: Patterns of Change in Pennsylvania Coal Swamps of the Illinois Basin,
W79-02955 2H

IMPERIAL COUNTY
Water Wells and Springs in Palo Verde Valley, Riverside and Imperial Counties, California,
W79-02647 7C

IMPOUNDMENTS
Recreation, (Colorado River Basin),
W79-02739 6B

INDEX OF CHANGE
A Measure of Response to Perturbation Used to Assess Structural Change in some Polluted and Unpolluted Stream Fish Communities,
W79-02996 5B

INDIA
Dug-Wells, Dug-Cum-Bore Wells, and Tubewells,
W79-02994 4B

INDIAN RESERVATIONS
Certain Water Right Claims of the AK-Chin Indian Community,
W79-02530 6E

INDICATOR BACTERIA BIOCONTROL
Effect of Mercury on NADH and the Protective Role of Oxalacetate,
W79-02596 5D

INDICATORS
Use of Commensal Protozoa as Biological Indicators of Water Quality and Pollution,
W79-02643 5C

INDUSTRIAL WASTES
Upgrading Textile Operations to Reduce Pollution, Volume I: In-Plant Control of Pollution.
W79-02504 5D

Characterization and Evaluation of Wastewater Sources, United States Steel Corporation, Irvin Plant, Pittsburgh, Pennsylvania, August 18-28, 1975.
W79-02515 5B

Financial Implications of Waste Management Systems for Shellfish Processing,
W79-02516 5G

Mineral Mining and Processing Point Source Category Effluent Guidelines and Standards: Phosphate Rock Mining,
W79-02534 5G

Baseline Report of Environmental Conditions in Deepwater Dumpsite 106, Vol I: Physical Characteristics.
W79-02622 5E

Baseline Report of Environmental Conditions in Deepwater Dumpsite 106, Volume II: Biological Characteristics.
W79-02623 5E

Characterization and Evaluation of Wastewater, United States Steel Corporation, Homestead Wheel and Axle Plant, McKees Rocks, Pennsylvania, August 21-28, 1975.
W79-02791 5G

Characterization and Evaluation of Wastewater Sources, United States Steel Corporation, Duquesne Plant, Pittsburgh, Pennsylvania, February 26-March 6, 1976.
W79-02793 5G

Owens-Corning Fiberglass Corporation Wastewater Treatment Facility, Anderson, South Carolina, Technical Support Project March-May 1973.
W79-02796 5D

Experience with Waste Water Acid Neutralization (Erfahrungen Mit Abwasser-Saurezneutralisation),
W79-02798 5D

PCBS Water Elimination/Reduction Technology and Associated Costs, Manufacturers of Electrical Capacitors and Transformers,
W79-02800 5D

Characterization and Evaluation of Wastewater Sources United States Steel Corporation, Edgar Thompson Plant, Pittsburgh, Pennsylvania, July 22-August 5, 1975.
W79-02801 5G

Container Corporation of America Brewton Mill-Conecuh-Escambia River Basin Study II,
W79-02804 5D

Paper Pulp Compounds Containing Active Sludge,
W79-02941 5D

Adsorbent for Industrial Effluents Preferably Containing Dyes,
W79-02943 5D

INDUSTRIAL WATER
Factual Inputs for Allocation Decisions Concerning Scarce Water Resources,
W79-02731 6B

INFILTRATION
Effects of Bottom Sediments on Infilration from the Miami and Tributary Canals to the Biscayne Aquifer, Dade County, Florida,
W79-02653 5B

Empirical Equations for Some Soil Hydraulic Properties,
W79-02679 2G

A Three-Dimensional Galerkin Finite Element Model for the Analysis of Contaminant Transport in Variably Saturated Porous Media, User's Guide,
W79-02838 5B

INFORMATION DISSEMINATION
Water Conservation Information Dissemination During the 1977 Drought Emergency,
W79-02904 3B

INFORMATION EXCHANGE
Water Conservation Information Dissemination During the 1977 Drought Emergency,
W79-02904 3B

INLAND WATERWAYS
Capacity Studies of Winfield Locks, Kanawha River, West Virginia,
W79-02858 8B

INLETS (WATERWAYS)
Hydraulics and Dynamics of New Corpus Christi Pass, Texas: A Case History, 1972-73,
W79-02707 8B

INSTITUTIONAL ASPECTS
Institutional Arrangements for Area-Wide Quality Planning and Management, Section 208 Applied in Three Metropolitan Areas of the Great Lakes,
W79-02819 5G

Water Resources Research Support Program 1978-1979,
W79-02928 6E

INSTITUTIONS
Issues, Interests and Power: Environmental Politics in the Community Setting,

JUVENILE FISH
Effects of Temperature on Hatching Success and Survival of Larvae in the White Bass,
W79-02965 5C

KACHEMAK BAY (ALAS)
Environmental Studies of Kachemak Bay and Lower Cook Inlet, Volume VI: Food Habits of Shrimp in Kachemak Bay, Alaska,
W79-02780 2L

KANAWHA RIVER (WV)
Capacity Studies of Winfield Locks, Kanawha River, West Virginia,
W79-02858 8B

KANEOHE BAY (OAHU)
Solution of Coupled Nonlinear Ecosystem Equations,
W79-02714 2L

KANSAS
Interim Report of the Governor's Task Force on Water Resources.
W79-02700 6D

KARST HYDROLOGY
Uncertainties of Karstic Water Resources Systems,
W79-02883 2F

KELPS
Sensitivity of Macrocystis Gametophytes to Copper,
W79-02586 5C

KOTZEBUE (ALASKA)
Investigation of Slumping Failure in an Earth Dam Abutment at Kotzebue, Alaska,
W79-02702 8D

LABORATORY TESTS
Culturing and Ecology Studies of the Rotifer Polyarthra Vulgaris,
W79-02624 5C

Design and Evaluation of Laboratory Ecological System Studies,
W79-02625 5C

Evaluation of Liner Materials Exposed to Leachate,
W79-02704 8G

Potential Alkali-Carbonate Rock Reactivity of Some of the Aggregate Used in Fishtrap Dam,
W79-02705 8F

An Investigation of Ice Forces on Vertical Structures,
W79-02865 2C

Experiments on the Structure of Turbulent Shear in Pipe Flows of Water
W79-02874 8B

The Detection of Heightened Sea-Water Copper Concentrations by the Mussel Mytilus Edulisl,
W79-02960 5A

Inexpensive Constant Water Level Device for Flow-Through Aquariums,
W79-02995 7B

LAKE CARNEGIE (NJ)
A Preliminary Investigation of the Phosphorus Loading Characteristics of Lake Carnegie, Princeton, New Jersey,
W79-02835 5B

LAKE CHAMPLAIN
Historical Land Use Changes and Impacts in Lake Champlain Wetlands (1941/42, 1962, 1974),
W79-02750 4C

LAKE HURON
Chemical Limnology of Georgian Bay, 1974,
W79-02923 5A

LAKE MICHIGAN
A Procedure to Determine Direct Diversions from Lake Michigan,
W79-02523 3D

Warm Bottom Water in Lake Michigan,
W79-02843 2H

LAKE POWELL
Concentrations of Ten Heavy Metals in Some Selected Lake Powell Game Fishes,
W79-02582 5B

LAKE SEDIMENTS
Determination of Alkylmercury Compounds in Lake Sediments by Steam Distillation-Flameless Atomic Absorption,
W79-02642 5A

LAKES
Lake Process Models Applied to Reservoir Management,
W79-02716 5A

The Role of Ice and Snow in Lake Heat Budgets,
W79-02844 2H

A New Method for Collecting Water Samples from Beneath the Ice,
W79-02845 7B

Assessment of the Physical and Biological Characteristics of the Major Lake Champlain Wetlands,
W79-02937 2H

LAMPREYS
Rapid Method for Determining Concentrations of Bayer 73 in Water During Lampricide Treatments,
W79-02891 5A

LAMPRICIDES
Rapid Method for Determining Concentrations of Bayer 73 in Water During Lampricide Treatments,
W79-02891 5A

LAND DEVELOPMENT
Protecting the California Coast.
W79-02554 6E

LAND USE
The Role of Agriculture, (Colorado River Basin),
W79-02738 3F

Spatial Changes in Waterfowl Habitat,
W79-02742 2H

Historical Land Use Changes and Impacts in Lake Champlain Wetlands (1941/42, 1962, 1974),
W79-02750 4C

LANDFILL LEACHATE
Interaction Between Landfill Leachates and Carbonate-Derived Residual Soils,
W79-02829 5B

LANDFILLS
Evaluation of the MC-300A Soil Moisture Meter to Determine In-Place Moisture Content of Refuse at Land Disposal Sites,
W79-02503 5A

Consequences of Leaching from Pulp and Paper Mill Landfill Operations.
W79-02591 5B

Handbook for Pesticide Disposal by Common Chemical Methods,
W79-02806 5E

Interaction Between Landfill Leachates and Carbonate-Derived Residual Soils,
W79-02829 5B

LARGEMOUTH BASS
Physiological Effects of Electrofishing on Largemouth Bass,
W79-02968 5C

LARVAE
Growth, Abundance and Distribution of Larval Tabanids in Experimentally Fertilized Plots on a Massachusetts Salt Marsh,
W79-02755 2L

LARVAL GROWTH STAGE
The Effects of Three Phthalate Esters on the Larval Development of the Grass Shrimp Palaemonetes Pugio (Holthuis),
W79-02786 5C

LAS VEGAS VALLEY (NV)
Las Vegas Valley Water Budget: Relationship of Distribution, Consumptive Use, and Recharge to Shallow Groundwater,
W79-02728 5G

LAUNDERING
Study on Power-Laundry Wastewater Treatment,
W79-02807 5D

Chemical and Biological Survey of Liberty Bay, Washington,
W79-02634 5C

Determination of Alkylmercury Compounds in Lake Sediments by Steam Distillation-Flameless Atomic Absorption,
W79-02642 5A

Control of Mercury Pollution,
W79-02885 5G

Trace Metals in Some Fish Species of South Carolina,
W79-02887 5A

Chlorinated Pesticides and Heavy Metals in Streams and Lakes of Northern Mississippi Water,
W79-02900 5B

Acumulacion Y Effectos Histopatologicos Del Mercurio Inorganico Y Organico En La Lisa (Mugil Auratus Risso) (Accumulation and Histopathological Effects of Inorganic and Organic Mercury on the Mullet),
W79-02958 5C

Acumulacion and Efectos Histopatologicos Del Cadmio Y El Mercurio En El Sapo (Halobatrachus Didactylus) (Accumulation and Histopathological Effect of Cadmium and of Mercury on the Sapo),
W79-02959 5C

Accelerated Rate of Albinism in Channel Catfish Exposed to Metals,
W79-02967 5C

Acute Toxicity of Mercury and Selenium to Crassostrea Gigas Embryos and Cancer Magister Larvae,
W79-02973 5C

METABOLISM
Microbial Degradation of Pesticides,
W79-02583 5

METALLIC IMPURITIES
Replacement of Metallic Impurities from Water by Metal Beds,
W79-02603 5F

METALS
Concentrations of Ten Heavy Metals in Some Selected Lake Powell Game Fishes,
W79-02582 5B

Detoxification of Metals by Marine Bivalves: An Ultrastructural Study of the Compartmentation of Copper and Zinc in the Oyster Ostrea Edulis,
W79-02784 5A

Trace Metals in Some Fish Species of South Carolina,
W79-02887 5A

Actions Ecotoxicologiques de Certains Metaux (CU-ZN-PB-CD) Chez Les Poissons Dulcaquicoles De La Riviere Lot (The Ecotoxicological

Action of some Metals (CU-ZN-PB-CD) on Freshwater Fish in the Lot River,
W79-02895 5C

The Detection of Heightened Sea-Water Copper Concentrations by the Mussel Mytilus Edulisl,
W79-02960 5A

Acute Toxicity of Mercury and Selenium to Crassostrea Gigas Embryos and Cancer Magister Larvae,
W79-02973 5C

METEOROLOGICAL DATA
What the Design Engineer Needs from the Hydrometeorologist,
W79-02683 7C

METHODOLOGY
Methodology Developed for Assessment of Fish and Macroinvertebrate Communities in the New River, Virginia,
W79-02606 5C

Culturing and Ecology Studies of the Rotifer Polyarthra Vulgaris,
W79-02624 5C

Techniques for Sampling and Analyzing the Marine Macrobenthos,
W79-02627 5A

Resource Demands for Energy Development in the Yellowstone River Basin,
W79-02726 6D

Utilisation Du Protozoaire Cilie Colpidium Campylum Pour La Mesure De La Toxicite Et De L'Accumulation Des Micropollutant: Analyse Critique et Applications (Use of the Ciliated Protozoa Colpidium Campylum for the Measurement of Toxicity and Accumulation of Micropollutants: Analysis and Application),
W79-02894 5C

Investigation of a Nutrient-Growth Model Using a Continuous Culture of Natural Phytoplankton,
W79-02962 5C

Seasonal Phytoplankton Production in the Western English Channel 1964-1974,
W79-02963 5C

An Exposure Scale for Marine Shores in Western Norway,
W79-02964 5B

Physiological Effects of Electrofishing on Largemouth Bass,
W79-02968 5C

An Improved Experimental Medium for Freshwater Toxicity Studies Using Daphnia Magna,
W79-02972 5C

Technique for Collecting Fish with a Block Net in a Pumped Storage Reservoir,
W79-02976 7B

Inexpensive Constant Water Level Device for Flow-Through Aquariums,
W79-02995 7B

METHYL PARATHION
Substitute Chemical Program - Initial Scientific and Minieconomic Review of Methyl Parathion.
W79-02633 5C

METHYLMERCURY
Investigation of Isothiocyanatopentaaquochromium (III) as a Reagent for the Separation and Identification of Nanogram Quantities of Mercury (I), Mercury (II), and Methylmercury (II),
W79-02589 5A

Effect of Mercury on NADH and the Protective Role of Oxalacetate,
W79-02596 5D

Acumulacion Y Effectos Histopatologicos Del Mercurio Inorganico Y Organico En La Lisa (Mugil Auratus Risso) (Accumulation and Histopathological Effects of Inorganic and Organic Mercury on the Mullet),
W79-02958 5C

Interactions of Methylmercury, Cadmium, and Salinity on Regeneration in the Fiddler Crabs Uca Pugilator, U. Pugnax and U. Minax,
W79-02974 5C

METROPOLITAN AREAS OF THE GREAT LAKES
Institutional Arrangements for Area-Wide Quality Planning and Management, Section 208 Applied in Three Metropolitan Areas of the Great Lakes,
W79-02819 5G

MICHIGAN
Seiche Structure and Vertical Mixing Below the Epilimnion in Small Lakes,
W79-02813 5C

MICROBIAL DEGRADATION
Microbial Degradation of Pesticides,
W79-02583 5

Effect of Mercury on NADH and the Protective Role of Oxalacetate,
W79-02596 5D

MICRONUTRIENTS
Effect of Irrigation, Lime, and Fertility Treatments on the yield and Chemical Composition of Soybeans,
W79-02991 3F

MICROORGANISMS
Electrochemical Biocide,
W79-02514 5D

MINE ACIDS
A Chemical and Biological Evaluation of Three Mine Drainage Treatment Plants,
W79-02794 5D

MINE WASTES
Evaluation of Proposed NPDES Limitations for Homestake Mining Company and Lead-Deadwood Sanitary District No. 1.
W79-02790 5G

MINING
Environmental Regulation of United States Deep Seabed Mining,
W79-02548 6E

Effects of Gravel Mining and Construction of Gravel Islands and Causeways.
W79-02612 5C

MINNESOTA
A Preliminary Classification of Wetland Plant Communities in North-Central Minnesota,
W79-02956 2I

MINNOWS
Age, Growth, and Food Habits of the Fathead Minnow, Pimephales Promelas, in North Dakota Saline Lakes,
W79-02590 2H

Chronic Toxicity of Chlordane, Trifluralin, and Pentachlorophenol to Sheepshead Minnows (Cyprinodon Variegatus),
W79-02631 5C

MISSISSIPPI
Some Impacts of Safe Drinking Water Standards on Rural Water Systems,
W79-02522 5G

Laws Passed During the 1976 Session of the Mississippi Legislature (concerning Maine and Coastal Zone),
W79-02526 6E

Laws Passed During the 1975 Session of the Mississippi Legislature (Concerning Marine and Coastal Zone),
W79-02528 6E

MISSISSIPPI RIVER
Suspended Sediment and Bed Material Studies on the Lower Mississippi River,
W79-02703 8B

Control of 1973 Mississippi River Flood,
W79-02717 4A

Laboratory Tests of Concrete Aggregate and Riprap for New Lock and Dam No. 26,
W79-02854 8F

MISSOURI
Interaction Between Landfill Leachates and Carbonate-Derived Residual Soils,
W79-02829 5B

The Effect of Organic Carbon on the Concentrations of Iron and Hydrogen Sulfide in Ground Water,
W79-02908 5A

MISSOURI RIVER
Taste and Odor, Missouri River, Iowa Tributaries Area, Iowa-Nebraska, 1970.
W79-02811 5G

MOBILITY
Adsorption, Mobility and Degradation of Cyanazine and Diuron in Soils,
W79-02909 5B

MODEL STATE INFORMATION SYSTEM
Introduction to the Model State Information System (MSIS).
W79-02520 5G

MODEL STUDIES
Subjective Detection of Differences in Variance from Small Samples,
W79-02597 6A

Unsteady Streamflow Simulation Using a Linear Implicit Finite-Difference Model,
W79-02644 2E

A Rainfall-Runoff Modeling Procedure for Improving Estimates of T-Year (Annual) Floods for Small Drainage Basins,
W79-02652 2E

Lake Process Models Applied to Reservoir Management,
W79-02716 5A

Simulation of Nutrient Loss from Soils Due to Rainfall Acidity,
W79-02730 5B

A Conceptual Ecological Model for Chesapeake Bay,
W79-02746 2L

Pollution Forecast in Streams.
W79-02831 5B

A Three-Dimensional Galerkin Finite Element Model for the Analysis of Contaminant Transport in Variably Saturated Porous Media, User's Guide,
W79-02838 5B

The Role of Ice and Snow in Lake Heat Budgets,
W79-02844 2H

MODEL STUDIES

Analytical Computation of the Three-Dimensional Steady-State Temperature Condition of a Dam,
W79-02856 8D

Multimode Modeling of the Water Molecule,
W79-02859 1A

An Investigation of Ice Forces on Vertical Structures,
W79-02865 2C

Coagulation of Monodisperse Collodal Particles in Locally Isotropic Turbulent Flows,
W79-02873 5D

Analysis of Consolidation of Earth and Rockfill Dams, Volume I, Main Text and Appendices A and B,
W79-02875 8D

The Calibration of a Phytoplankton Growth Model Using Batch Culture Data,
W79-02878 5C

A Model of Stand Photosynthesis for the Wet Meadow Tundra at Barrow, Alaska,
W79-02946 2I

MODELING STUDIES

Application of Computer Waveform Matching to Monitoring of Hydrologic System Parameters,
W79-02836 7C

MODIFIED FICKIAN MODELS

Pollution Forecast in Streams,
W79-02831 5B

MOISTURE CONTENT

Evaluation of the MC-300A Soil Moisture Meter to Determine In-Place Moisture Content of Refuse at Land Disposal Sites,
W79-02503 5A

MOISTURE STRESS

The Recovery of Leaf Water Potential, Transpiration, and Photosynthesis of Cotton During Irrigation Cycles,
W79-02990 2D

MOLECULAR RESPONSE

Benzo(A)Pyrene Monooxygenase Induction in Marine Fish -Molecular Response to Oil Pollution,
W79-02898 5C

MOLECULAR STRUCTURE

Multimode Modeling of the Water Molecule,
W79-02859 1A

MOLLUSCS

Factors Controlling the Availability of Sediment-Bound Lead to the Estuarine Bivalve Scrobicularia Plana,
W79-02961 5C

MOLLUSKS

Use of Commensal Protozoa as Biological Indicators of Water Quality and Pollution,
W79-02643 5C

MONITORING

Introduction to the Model State Information System (MSIS).
W79-02520 5G

A Biomonitoring Procedure Utilizing Negative Photoaxis of First Instar Aedes Aegypti Larvae,
W79-02593 5A

Dissolved-Oxygen Regimen of the Willamette River, Oregon, Under Conditions of Basinwide Secondary Treatment,
W79-02657 5G

Non-Point Source Water Quality Monitoring, Inyo National Forest, 1975,
W79-02718 5A

Dew-Monitoring Network in the Southeast,
W79-02853 7B

An Exposure Scale for Marine Shores in Western Norway,
W79-02964 5B

MONOGAHELA RIVER

Characterization and Evaluation of Wastewater Sources, United States Steel Corporation, Irvin Plant, Pittsburgh, Pennsylvania, August 18-28, 1975.
W79-02515 5B

MONONGAHELA RIVER

Characterization and Evaluation of Wastewater Sources, United States Steel Corporation, Duquesne Plant, Pittsburgh, Pennsylvania, February 26-March 6, 1976.
W79-02793 5G

Characterization and Evaluation of Wastewater Sources United States Steel Corporation, Edgar Thompson Plant, Pittsburgh, Pennsylvania, July 22-August 5, 1975.
W79-02801 5G

MONTANA

Assessment and Implementation of In-Stream Value Studies for the Northern Great Plains,
W79-02709 4A

MORPHOLOGIC PROPERTIES (SOILS)

Soil Morphologic and Hydraulic Changes Associated with Wastewater Irrigation,
W79-02817 5G

MORTALITY

Experiments with Littorina Species to Determine the Relevancy of Oil Spill Data from Southern California to the Gulf of Alaska,
W79-02621 5C

Chronic Toxicity of Chlordane, Trifluralin, and Pentachlorophenol to Sheepshead Minnows (Cyprinodon Variegatus),
W79-02631 5C

The Effects of Three Phthalate Esters on the Larval Development of the Grass Shrimp Palaemonetes Pugio (Holthuis),
W79-02786 5C

Effects of Temperature on Hatching Success and Survival of Larvae in the White Bass,
W79-02965 5C

Lethality of Electroshock to Two Freshwater Fishes,
W79-02969 5C

MOTTLING

Soil Morphologic and Hydraulic Changes Associated with Wastewater Irrigation,
W79-02817 5G

MOVEMENT

Nicomekl-Serpentine Basin Study, British Columbia,
W79-02785 4B

MULTIOBJECTIVE MANAGEMENT

A Multiobjective Approach to Managing a Southern Arizona Watershed,
W79-02881 4D

MULTIPLE OBJECTIVE

Multiobjective Trade-Off Risks in Reservoir Operation,
W79-02915 4A

MULTIPLE PURPOSE

The Role of Agriculture, (Colorado River Basin),
W79-02738 3F

MULTIPLE-PURPOSE RESERVOIRS

Preimpoundment Study Little Black Creek Drainage Basn Black Creek Watershed Bulloch County, Georgia,
W79-02635 5C

MULTIVARIATE ANALYSIS

The Potential and Realized Influences of Temperature on the Distribution of Fishes in the New River, Glen Lyn, Virginia,
W79-02903 5C

MUNICIPAL SEWAGE EFFLUENT

Avian Communities and Habitat Components in Natural and Wastewater-Irrigated Environments,
W79-02601 5G

MUNICIPAL WASTES

Contribution of Chronic Petroleum Inputs to Narragansett Bay and Rhode Island Sound Sediments,
W79-02942 5B

MUNICIPAL WATER

New Considerations for Municipal Water System Planning,
W79-02729 6B

MUNITIONS EFFLUENTS

Aquatic Field Surveys at Holston Army Ammunition Plant, Kingsport Tennessee, Final Report,
W79-02630 5C

MUSSELS

The Detection of Heightened Sea-Water Copper Concentrations by the Mussel Mytilus Edulisl,
W79-02960 5A

MUTAGENS

Feasibility of Using Bacterial Strains (Mutagenesis) to Test for Environmental Carcinogens,
W79-02626 5C

NAPHTHALENE

Bioaccumulation Potential of Polycyclic Aromatic Hydrocarbons in Daphnia Pulex,
W79-02982 5C

NATIONAL FORESTS

Non-Point Source Water Quality Monitoring, Inyo National Forest, 1975,
W79-02718 5A

NATIONAL SEASHORES

Environmental Assessment - Alternatives of General Management Plan and Wilderness Study for Cape Lookout National Seashore, North Carolina.
W79-02525 6G

NATURAL STREAMS

Field Estimates of Aquatic Plant Respiration and its Application of Stream Dissolved Oxygen Budgets,
W79-02816 5C

NAVIGATION

Capacity Studies of Winfield Locks, Kanawha River, West Virginia,
W79-02858 8B

NEGOTIATIONS

The Seabed Negotiation and the Law of the Sea Conference -- Ready for a Divorce,
W79-02549 6E

The Law of the Sea Conference at the Crossroads,
W79-02577 6E

NEMATODES
Soybean Yields and Lance Nematode Populations as Affected by Subsoiling, Fertility, and Nematicide Treatments,
W79-02989 3F

NESTS
Nesting Wading Bird Populations in Southern Florida,
W79-02753 2I

NEUTRALIZATION
Experience with Waste Water Acid Neutralization (Erfahrungen Mit Abwasser-Saureneutralisation),
W79-02798 5D

NEUTRON ACTIVATION ANALYSIS
Use of Neutron Activatable Tracers for Simulating Water and Chemical Flow Through Porous Media,
W79-02814 5B

NEVADA
Las Vegas Valley Water Budget: Relationship of Distribution, Consumptive Use, and Recharge to Shallow Groundwater,
W79-02728 5G

NEW JERSEY
Environmental Factors Limiting the Distribution of Five Plant Species on Salt Marshes of Island Beach, New Jersey,
W79-02678 2L

Lake Process Models Applied to Reservoir Management,
W79-02716 5A

A Preliminary Investigation of the Phosphorus Loading Characteristics of Lake Carnegie, Princeton, New Jersey,
W79-02835 5B

NEW MEXICO
Pueblo Water Rights on the Upper Rio Grande,
W79-02818 6E

NEW RIVER (VA)
The Potential and Realized Influences of Temperature on the Distribution of Fishes in the New River, Glen Lyn, Virginia,
W79-02903 5C

NEW RIVER (VIRGINIA)
Methodology Developed for Assessment of Fish and Macroinvertebrate Communities in the New River, Virginia,
W79-02606 5C

NEW YORK
Bohemian Brethren Presbyterian Church v. Greek Archdiocesan Cathedral of the Holy Trinity (Runoff Damage Resulting from Grading of Adjoining Property).
W79-02566 6E

Spears v. Berle (Wetlands Property Use Restrictions not a Faking When Serving a Public Purpose).
W79-02570 6E

N15/N14 Ratios of Ground-Water Nitrate, Long Island, New York,
W79-02689 5B

Lake Process Models Applied to Reservoir Management,
W79-02716 5A

An Economic Analysis of Alternative Federal Flood Damage Assistance Programs.
W79-02824 6F

NEW YORK BIGHT
Fine Structure Instabilities Induced by Double Diffusion in the Shelf/Slope Water Front,
W79-02851 2L

Distribution and Abundance of Benthic Organisms in the New York Bight, First and Second Monitoring Cruises, November 1975 and March 1976,
W79-02922 5C

NEWBERG AREA
Groundwater in the Newberg Area, Northern Willamette Valley, Oregon,
W79-02650 2F

NICOMEKL-SERPENTINE DRAINAGE BASIN (B C)
Nicomekl-Serpentine Basin Study, British Columbia,
W79-02785 4B

NITRATES
Distribution of Dissolved Nitrate and Fluoride in Ground Water, Highland-East Highlands, San Bernardino County, California,
W79-02663 5B

N15/N14 Ratios of Ground-Water Nitrate, Long Island, New York,
W79-02689 5B

Untersuchungen Zur Intensivhaltung Von Fischen Im Warm-Wasserkreislauf (Studies Regarding Intensified Fish Culture in a Closed Warm Water System),
W79-02896 5C

NITRIFICATION
Effects of Wastewater Process Operation on Organics in Potable Water Supplies,
W79-02815 5D

NITROGEN
Pools of Nitrogen in a Georgia Salt Marsh,
W79-02899 5C

Yield and Quality of Corn and Grain Sorghum Grain and Residues as Influenced by N Fertilization,
W79-02987 3F

Response Curves of Various Turfgrasses to Application of Several Controlled-Release Nitrogen Sources,
W79-02988 3F

Effect of Irrigation and Nitrogen on the Dry Matter and Crude Protein Yields of 'Pangola' Digitgrass,
W79-02992 3F

NITROGEN COMPOUNDS
Experience with Waste Water Acid Neutralization (Erfahrungen Mit Abwasser-Saureneutralisation),
W79-02798 5D

NITROGEN CYCLE
Simulation of Potential Effects of Forest Utilization on the Nitrogen Cycle in Different Southeastern Ecosystems,
W79-02573 4D

NO. 2 FUEL OIL
Benzo(A)Pyrene Monooxygenase Induction in Marine Fish -Molecular Response to Oil Pollution,
W79-02898 5C

NON-POINT SOURCES
Non-Point Source Water Quality Monitoring, Inyo National Forest, 1975,
W79-02718 5A

NONMETALLIC WATERSTOPS
Nonmetallic Waterstops,
W79-02712 8F

NONSTRUCTURAL ALTERNATIVES
NEPA's Effect on the Consideration of Alternatives: A Crucial Test,
W79-02607 5G

NORTH CAROLINA
Environmental Assessment - Alternatives of General Management Plan and Wilderness Study for Cape Lookout National Seashore, North Carolina.
W79-02525 6G

An Overview of Nutrient Cycling Research at Coweeta Hydrologic Laboratory,
W79-02571 4D

Nutrient Budgets for Undisturbed and Manipulated Hardwood Forest Ecosystems in the Mountains of North Carolina,
W79-02574 4D

The Genetic Basis of the Ecological Amplitude of Spartina Patens on the Outer Banks of North Carolina,

NUTRIENTS

Nutrient Limitations to Plant Production in Two Tundra Communities,
W79-02947 2I

Investigation of a Nutrient-Growth Model Using a Continuous Culture of Natural Phytoplankton,
W79-02962 5C

Nutrient Regeneration by Zooplankton During a Red Tide off Peru, with Notes on Biomass and Species Composition of Zooplankton,
W79-02975 5C

Effect of Irrigation, Lime, and Fertility Treatments on the yield and Chemical Composition of Soybeans,
W79-02991 3F

OCEAN DUMPING

Baseline Report of Environmental Conditions in Deepwater Dumpsite 106. Vol I: Physical Characteristics.
W79-02622 5E

Baseline Report of Environmental Conditions in Deepwater Dumpsite 106. Volume II: Biological Characteristics.
W79-02623 5E

OCEANS

Organizing for a National Oceans Program,
W79-02556 6E

Solar Middle Ultraviolet (UV-B) Measurement in Coastal Waters Rich in Yellow Substance,
W79-02849 2L

OFFSHORE PLATFORMS

Environmental Hazards to Offshore Operations.
W79-02613 5C

Ecological Effects of an Artificial Island, Rincon Island Punta Gorda, California,
W79-02614 6G

OHIO RIVER

Engineerin Condition Survey and Structural investigation of Emsworth Locks and Dam, Ohio River,
W79-02706 8F

Condition Survey of Lock and Dam 3, Ohio River,
W79-02711 8F

Characterization and Evaluation of Wastewater, United States Steel Corporation, Homestead Wheel and Axle Plant, McKees Rocks, Pennsylvania, August 21-28, 1975.
W79-02791 5G

OIL

Fate and Effects of Crude Oil Spilled on Permafrost Terrain. First Year Progress Report,
W79-02902 5B

OIL INDUSTRY

Managing Oil and Gas Activities in Coastal Environments,
W79-02931 5G

OIL POLLUTION

Emergency Suspension Procedures for Outer Continental Shelf Oil and Gas Operations,
W79-02532 5G

Environmental Assessment of the Alaskan Continental Shelf. Interim Synthesis: Beaufort/Chukchi.
W79-02608 5C

A Biologist Looks at Oil in the Sea,
W79-02615 5G

Effects of Bunker C Oil and an Oil Dispersant: Part 2--Effects on the Accumulation of Chlorine-Labelled Bunker C Oil in Various Fish Tissues,
W79-02620 5C

Sublethal Effects of Treated Liquid Effluent from a Petroleum Refinery on Freshwater Organisms,
W79-02929 5C

Contribution of Chronic Petroleum Inputs to Narragansett Bay and Rhode Island Sound Sediments,
W79-02942 5B

The Presence of Pollutant Hydrocarbons in Estuarine Epipelic Diatom Populations,
W79-02998 5C

OIL SHALE

Analysis and Characterization of Trace Elements in Shale Oil Products by Instrumental Neutron Activation Analysis,
W79-02822 5A

OIL SPILLS

Emergency Suspension Procedures for Outer Continental Shelf Oil and Gas Operations,
W79-02532 5G

The Water Quality Improvement Act of 1970, The 1972 Amendments and State Antipollution Laws,
W79-02542 5G

Probable Impacts and Consequences of Oil Development,
W79-02611 5C

A Biologist Looks at Oil in the Sea,
W79-02615 5G

Vulnerability of Coastal Environments to Oil Spill Impacts,
W79-02616 5G

Experiments with Littorina Species to Determine the Relevancy of Oil Spill Data from Southern California to the Gulf of Alaska,
W79-02621 5C

An Oilspill Risk Analysis for the Mid-Atlantic (Proposed Sale 49) Outer Continental Shelf Lease Area,
W79-02661 5G

Benzo(A)Pyrene Monooxygenase Induction in Marine Fish -Molecular Response to Oil Pollution,
W79-02898 5C

Fate and Effects of Crude Oil Spilled on Permafrost Terrain. First Year Progress Report,
W79-02902 5B

The Presence of Pollutant Hydrocarbons in Estuarine Epipelic Diatom Populations,
W79-02998 5C

OIL WASTES

Sublethal Effects of Treated Liquid Effluent from a Petroleum Refinery on Freshwater Organisms,
W79-02929 5C

OKLAHOMA

Hodges v. Oklahoma Water Resources Board (Water Resources Board Grant of Temporary Permit for Non-Domestic Groundwater Use Upheld).
W79-02557 6E

Oklahoma Water Resources Board v. City of Lawton (Springwater Heated as Stream Water for Appropriation Permit Application),
W79-02561 6E

Water Resources Data for Oklahoma, Water Year 1977--Volume 2. Red River Basin.
W79-02665 7C

Water Resources Data for Oklahoma, Water Year 1977--Volume 1. Arkansas River Basin
W79-02667 7C

OLIGOCHAETES

Les Oligochetes D'un Cours D'eau Montagnard Pollue: Le Bief Rouge (The Oligochaetes of a Polluted Mountain Stream: The Bief Rouge),
W79-02893 5C

OMAHA

Taste and Odor, Missouri River, Iowa Tributaries Area, Iowa-Nebraska, 1970.
W79-02811 5G

ON-SITE DATA COLLECTIONS

Trace Metals in the Waters of a Partially Mixed Estuary,

OOIDS

High-Magnesium Calcite Ooids from the Great Barrier Reef,
W79-02999 2L

OPTIMIZATION

A Procedure to Determine Direct Diversions from Lake Michigan,
W79-02523 3D

Optimizing Irrigation System Design,
W79-02672 3F

Application of Computer Waveform Matching to Monitoring of Hydrologic System Parameters,
W79-02836 7C

Multiobjective Trade-Off Risks in Reservoir Operation,
W79-02915 4A

OREGON

Condition Survey-Asbestos-Bonded Steel Culverts in Western Oregon,
W79-02870 8G

ORGANIC CARBON

Interaction Between Landfill Leachates and Carbonate-Derived Residual Soils,
W79-02829 5B

The Effect of Organic Carbon on the Concentrations of Iron and Hydrogen Sulfide in Ground Water,
W79-02908 5A

ORGANIC COMPOUNDS

The Presence of Pollutant Hydrocarbons in Estuarine Epipelic Diatom Populations,
W79-02998 5C

ORGANIC MATTER

The Influence of Environmental Factors on the Distribution, Composition, and Transport of Microbial Biomass and Suspended Material in a Salt Marsh Ecosystem,
W79-02673 5B

ORLANDO AREA (FLA)
Preliminary Appraisal of the Geohydrologic Aspects of Drainage Wells, Orlando Area, Central Florida,
W79-02656 4B

OSPREY
Productivity of Ospreys in Connecticut-Long Island Increases as DDE Residue Declines,
W79-02886 5C

OUTER CONTINENTAL SHELF
Environmental Assessment of the Alaskan Continental Shelf. Interim Synthesis: Beaufort/Chukchi.
W79-02608 5C

Species, Habitats and Processes Sensitive to OCS Development,
W79-02609 5C

Trophic Interactions.
W79-02610 5C

Probable Impacts and Consequences of Oil Development,
W79-02611 5C

Effects of Gravel Mining and Construction of Gravel Islands and Causeways.
W79-02612 5C

Environmental Hazards to Offshore Operations.
W79-02613 5C

Ecological Effects of an Artificial Island, Rincon Island Punta Gorda, California,
W79-02614 6G

A Biologist Looks at Oil in the Sea,
W79-02615 5G

Vulnerability of Coastal Environments to Oil Spill Impacts,
W79-02616 5G

Effects of Bunker C Oil and an Oil Dispersant: Part 2--Effects on the Accumulation of Chlorine-Labelled Bunker C Oil in Various Fish Tissues,
W79-02620 5C

Experiments with Littorina Species to Determine the Relevancy of Oil Spill Data from Southern California to the Gulf of Alaska,
W79-02621 5C

Baseline Report of Environmental Conditions in Deepwater Dumpsite 106. Vol I: Physical Characteristics.
W79-02622 5E

Baseline Report of Environmental Conditions in Deepwater Dumpsite 106. Volume II: Biological Characteristics.
W79-02623 5E

Distribution and Abundance of Benthic Organisms in the New York Bight, First and Second Monitoring Cruises, November 1975 and March 1976,
W79-02922 5C

OUTER CONTINENTAL SHELF LEASE AREA
An Oilspill Risk Analysis for the Mid-Atlantic (Proposed Sale 49) Outer Continental Shelf Lease Area,
W79-02661 5G

OVERLAND FLOW
Concerned Citizens for Orderly Progress v. Commonwealth of Pennsylvania, Dept. of Environmental Resources (Sewage Facility Construction Permit Upheld).
W79-02569 6E

OWNERSHIP OF BEDS
Tidelands and the Public Trust: An Application for South Carolina,
W79-02539 6E

Equal Footing Doctrine does not Require Application of Federal Common Law to Resolve Ownership of Land Underlying Navigable Waterways which are not Interstate Boundaries,
W79-02551 6E

OXALACETATE
Effect of Mercury on NADH and the Protective Role of Oxalacetate,
W79-02596 5D

OXIDATION-REDUCTION POTENTIAL
The Effect of Organic Carbon on the Concentrations of Iron and Hydrogen Sulfide in Ground Water,
W79-02908 5A

OXIDATION-REDUCTION POTENTIALS
An Inexpensive and Easily Fabricated Sampler for Colecting Sediment Cores to Measure EH Potentials,
W79-02917 7B

OXYGEN
Water Quality Assessment Model - Oxygen Dynamics Model for Low-Flow Streams,
W79-02579 5B

OXYGEN REQUIREMENTS
Osmotic Balance and Respiration in the Hermit Crab, Pagurus Bernhardus, Exposed to Fluctuating Salinities,
W79-02957 5C

OYSTERS
Chemical and Biological Survey of Liberty Bay, Washington,
W79-02634 5C

Detoxification of Metals by Marine Bivalves: An Ultrastructural Study of the Compartmentation of Copper and Zinc in the Oyster Ostrea Edulis,
W79-02784 5A

OZONATION
Microbiological Considerations of Ozone Treatment of Reuse Water in Fish Hatcheries,
W79-02823 5D

OZONE
Oxidation of Pesticides by Ozone and Ultraviolet Light,
W79-02799 5D

Microbiological Considerations of Ozone Treatment of Reuse Water in Fish Hatcheries,
W79-02823 5D

PACIFIC COAST REGION
Plant and Animal Communities of Pacific North American Salt Marshes,
W79-02770 2L

PACIFIC COASTAL PLAIN
Tidal Salt-Marsh and Mangal Formations of Middle and South America,
W79-02771 2L

PALO VERDE VALLEY
Water Wells and Springs in Palo Verde Valley, Riverside and Imperial Counties, California,
W79-02647 7C

PALYNOLOGY
Fossil Plants and Coal: Patterns of Change in Pennsylvania Coal Swamps of the Illinois Basin,
W79-02955 2H

PANAMA CANAL ZONE
The White Amur as a Biological Control Agent of Aquatic Weeds in the Panama Canal,
W79-02892 5G

PANGOLA DIGITGRASS
Effect of Irrigation and Nitrogen on the Dry Matter and Crude Protein Yields of 'Pangola' Digitgrass,
W79-02992 3F

PARAQUAT
Toxicity of Selected Chemicals to the Fairy Shrimp, Streptocephalus Seali, Under Laboratory and Field Conditions,
W79-02971 5C

PARTICLE SIZE
Supplement to 'Effects of Thermal Discharges on Physico-Chemical Processes and Water Quality' Vistula River, Poland,
W79-02581 5C

PATENTS
Adsorbent for Industrial Effluents Preferably Containing Dyes,
W79-02943 5D

PATH OF POLLUTANTS
Hydrologic Data for Urban Storm Runoff from Three Localities in the Denver Metropolitan Area, Colorado,
W79-02646 7C

Preliminary Hydrologic Budget of the Sand-and-Gravel Aquifer Under Unstressed Conditions, with a Section on Water-Quality Monitoring, Pensacola, Florida,
W79-02664 5B

Transport of Agricultural Chemicals from Small Upland Piedmont Watersheds,
W79-02745 5B

A Preliminary Investigation of the Phosphorus Loading Characteristics of Lake Carnegie, Princeton, New Jersey,
W79-02835 5B

A Three-Dimensional Galerkin Finite Element Model for the Analysis of Contaminant Transport in Variably Saturated Porous Media, User's Guide,
W79-02838 5B

Adsorption, Mobility and Degradation of Cyanazine and Diuron in Soils,
W79-02909 5B

A Chemical Model of Heavy Metals in the Great Salt Lake,
W79-02913 5B

Factors Controlling the Availability of Sediment-Bound Lead to the Estuarine Bivalve Scrobicularia Plana,
W79-02961 5C

PEAT
The Relationship Between Net Primary Production and Accumulation for a Peatland in Southeastern Manitoba,
W79-02938 5C

Fossil Plants and Coal: Patterns of Change in Pennsylvania Coal Swamps of the Illinois Basin,
W79-02955 2H

PENALTIES (LEGAL)
The Water Quality Improvement Act of 1970, The 1972 Amendments and State Antipollution Laws,
W79-02542 5G

PENNINES
The Productivity of a Range of Blanket Bog Vegetation Types in the Northern Pennines,
W79-02945 2I

PENNSYLVANIA
Concerned Citizens for Orderly Progress v. Commonwealth of Pennsylvania, Dept. of Envi-

ronmental Resources (Sewage Facility Construction Permit Upheld).
W79-02569 6E

The Development of Flood-Potential Index Maps for Pennsylvania,
W79-02598 4A

Avian Communities and Habitat Components in Natural and Wastewater-Irrigated Environments,
W79-02601 5G

Bacteriological Water Quality of Tulpehocken Creek Basin, Berks and Lebanon Counties, Pennsylvania,
W79-02654 5B

Lake Process Models Applied to Reservoir Management,
W79-02716 5A

Parasites and Related Pathology of the Cottontail Rabbit (Sylvilagus floridanus) in central Pennsylvania,
W79-02833 5C

PENSACOLA (FLA)
Preliminary Hydrologic Budget of the Sand-and-Gravel Aquifer Under Unstressed Conditions, with a Section on Water-Quality Monitoring, Pensacola, Florida,
W79-02664 5B

PENTACHLOROPHENOL
Chronic Toxicity of Chlordane, Trifluralin, and Pentachlorophenol to Sheepshead Minnows (Cyprinodon Variegatus),
W79-02631 5C

PERCOLATION
Interaction Between Landfill Leachates and Carbonate-Derived Residual Soils,
W79-02829 5B

PERFORMANCE
Subjective Detection of Differences in Variance from Small Samples,
W79-02597 6A

PERIPHYTON
Aquatic Field Surveys at Holston Army Ammunition Plant, Kingsport Tennessee, Final Report,
W79-02630 5C

PERMAFROST
Specific Features of Construction of Thawed Soil Dams in Severe Climate Conditions,
W79-02693 8D

Thermal Regime of Earth-Rock Dams Constructed in the Far North,
W79-02694 8D

Fundamentals of Constructing Frozen Type Earth Dams in the Arctic,
W79-02695 8D

Evaluation of Stability of Earth-Fill Dam Based on Strength of Frozen Zones of its Profile,
W79-02696 8D

Studies of Nonstationary Temperature Regime of Frozen Dams Made of Local Materials on Permafrost Foundations.
W79-02698 8D

Investigation of Slumping Failure in an Earth Dam Abutment at Kotzebue, Alaska,
W79-02702 8D

Analytical Computation of the Three-Dimensional Steady-State Temperature Condition of a Dam,
W79-02856 8D

Dam of the Anadyrsk Thermal Electric Power Station,
W79-02862 8D

Fate and Effects of Crude Oil Spilled on Permafrost Terrain. First Year Progress Report,
W79-02902 5B

PERMANGANATES
The Use of Potassium Permanganate (KMNO4) in Fisheries; A Literature Review,
W79-02585 5G

PERMITS
Rules and Procedures for Application for Coastal Construction Permits.
W79-02559 6E

Niagra of Wisconsin Paper Corp. v. Wisconsin Dept. of Natural Resources (State Effluent Discharge Permits must be Modified in Accordance with State Law to Comply with EPA Standards.
W79-02560 6E

Spears v. Berle (Wetlands Property Use Restrictions not a Faking When Serving a Public Purpose).
W79-02570 6E

PERSONNEL
Program Implementation Procedures: Implementation of Two Year Post High School Wastewater Technology Instructional Programs.
W79-02789 5G

PERYLENE
Bioaccumulation Potential of Polycyclic Aromatic Hydrocarbons in Daphnia Pulex,
W79-02982 5C

PESTICIDE DISPOSAL
Disposal of Dilute Pesticide Solutions,
W79-02795 5E

Handbook for Pesticide Disposal by Common Chemical Methods,
W79-02806 5E

PESTICIDE KINETICS
Substitute Chemical Program - Initial Scientific and Minieconomic Review of Methyl Parathion.
W79-02633 5C

Fate of 2,3,7,8-Tetrachlorodibenzo-P-Dioxin (TCDD) in the Environment: Summary and Decontamination Recommendations,
W79-02639 5B

PESTICIDE REMOVAL
Oxidation of Pesticides by Ozone and Ultraviolet Light,
W79-02799 5D

PESTICIDE RESIDUES
Microbial Degradation of Pesticides,
W79-02583 5

Productivity of Ospreys in Connecticut-Long Island Increases as DDE Residue Declines,
W79-02886 5C

Chlorinated Pesticides and Heavy Metals in Streams and Lakes of Northern Mississippi Water,
W79-02900 5B

PESTICIDE TOXICITY
Substitute Chemical Program - Initial Scientific and Minieconomic Review of Methyl Parathion.
W79-02633 5C

Productivity of Ospreys in Connecticut-Long Island Increases as DDE Residue Declines,
W79-02886 5C

PESTICIDES
Detection of Water Pollutants by Laser Excited Resonance Raman Spectroscopy; Pesticides and Fungicides,
W79-02576 5A

Microbial Degradation of Pesticides,
W79-02583 5

Substitute Chemical Program - Initial Scientific and Minieconomic Review of Methyl Parathion.
W79-02633 5C

Transport of Agricultural Chemicals from Small Upland Piedmont Watersheds,
W79-02745 5B

The Accumulation, Translocation and Degradation of Biocides at Land Wastewater Disposal Sites: The Fate of Malathion, Carbaryl, Diazinon, and 2,4-D Butoxyethyl Ester,
W79-02890 5B

Rapid Method for Determining Concentrations of Bayer 73 in Water During Lampricide Treatments,
W79-02891 5A

PETROLOGY
High-Magnesium Calcite Ooids from the Great Barrier Reef,
W79-02999 2L

PHENANTHRENE
Bioaccumulation Potential of Polycyclic Aromatic Hydrocarbons in Daphnia Pulex,
W79-02982 5C

PHENOLS
Feasibility of Removing Phenols from Surface Waters by Carbon Adsorption,
W79-02880 5D

PHOSPHATES
Mineral Mining and Processing Point Source Category Effluent Guidelines and Standards: Phosphate Rock Mining,
W79-02534 5G

Banning Detergent Phosphates - The Debate Continues,
W79-02543 5G

Cathodic Stripping Methods for the Determination of Phosphate and Arsenate in Natural Waters,
W79-02602 5A

A Preliminary Investigation of the Phosphorus Loading Characteristics of Lake Carnegie, Princeton, New Jersey,
W79-02835 5B

Application of High Performance Liquid Chromatography to the Study of Dissolved Organic Phosphorus Compounds Released by Algae,
W79-02906 5A

PHOSPHORUS
A Field Study of Treatment vs. Depth of Sand Fill in a Mound System,
W79-02604 5D

Transformations of Organic Phosphorus Substrates in Soils as Evaluated by NaHCO3 Extraction,
W79-02674 2K

A Preliminary Investigation of the Phosphorus Loading Characteristics of Lake Carnegie, Princeton, New Jersey,
W79-02835 5B

Chromatographic Studies of Dissolved Organic Phosphorus Compounds Resulting from Algal Cultures,
W79-02907 5A

PHOSPHORUS COMPOUNDS
Transformations of Organic Phosphorus Substrates in Soils as Evaluated by NaHCO3 Extraction,
W79-02674 2K

PHOTOGRAPHY WASTES
Waste Disposal Study, Evaluation of Methods to Recover Reusable Chemicals from Evaporated Photowastes,
W79-02809 5E

PHOTOSYNTHESIS
The Recovery of Leaf Water Potential, Transpiration, and Photosynthesis of Cotton During Irrigation Cycles,
W79-02990 2D

PHYSIOLOGICAL ECOLOGY
The Genetic Basis of the Ecological Amplitude of Spartina Patens on the Outer Banks of North Carolina,
W79-02669 2L

PHYTOPLANKTON
The Calibration of a Phytoplankton Growth Model Using Batch Culture Data,
W79-02878 5C

Nutrient-Phytoplankton Relationships in the Holland Marsh, Ontario,
W79-02944 5C

Investigation of a Nutrient-Growth Model Using a Continuous Culture of Natural Phytoplankton,
W79-02962 5C

Seasonal Phytoplankton Production in the Western English Channel 1964-1974,
W79-02963 5C

Nutrient Regeneration by Zooplankton During a Red Tide off Peru, with Notes on Biomass and Species Composition of Zooplankton,
W79-02975 5C

Phytoplankton and Cooling Systems: Temperature Effects Using Different Intake and Discharge Depths,
W79-02980 5C

PHYTOPLANKTON PRODUCTION
Seasonal Phytoplankton Production in the Western English Channel 1964-1974,
W79-02963 5C

PHYTOPLANKTON SPECIES SUCCESSION
Phytoplankton and Cooling Systems: Temperature Effects Using Different Intake and Discharge Depths,
W79-02980 5C

PIEDMONT
Forest Service Studies of Soil and Nutrient Losses Caused by Roads, Logging, Mechanical Site Preparation, and Prescribed Burning in the Southeast,
W79-02572 5B

PIKES
The Effect of Arsenic on the Thermal Tolerance and Survival of Newly Hatched Muskellunge Fry (Esox Masquinongy),
W79-02587 5C

PIPE FLOW
Experiments on the Structure of Turbulent Shear in Pipe Flows of Water
W79-02874 8B

PIPELINES
Fate and Effects of Crude Oil Spilled on Permafrost Terrain. First Year Progress Report,
W79-02902 5B

PIPES
Predicting Performance of Pipe Culverts Buried in Soil,
W79-02869 8D

PLANKTONIC DIATOMS
Seiche Structure and Vertical Mixing Below the Epilimnion in Small Lakes,
W79-02813 5C

PLANNING
Environmental Impact Assessment.
W79-02524 6G

The Clean Water Act of 1977,
W79-02538 5G

Protecting the California Coast.
W79-02554 6E

Resource Demands for Energy Development in the Yellowstone River Basin,
W79-02726 6D

New Considerations for Municipal Water System Planning,
W79-02729 6B

Carrying Capacity and Planning, (Colorado River Basin),
W79-02741 6B

Institutional Arrangements for Area-Wide Quality Planning and Management, Section 208 Applied in Three Metropolitan Areas of the Great Lakes,
W79-02819 5G

Multiobjective Trade-Off Risks in Reservoir Operation,
W79-02915 4A

PLANT PATHOGENS
Host Specificity of Cercospora Rodmanii, A Potential Biological Control of Waterhyacinth,
W79-02884 4A

PLANT PHYSIOLOGY
Selenium Metabolism in the Marine Phytoplankters Tetraselmis Tetrathele and Dunaliella Minuta,
W79-02979 5C

POLIOVIRUS
An Assessment of the Occurrence of Human Viruses in Long Island Aquatic Systems,
W79-02584 5C

POLITICAL ASPECTS
Issues, Interests and Power: Environmental Politics in the Community Setting,
W79-02825 6B

POLLEN
Developmental and Environmental History of the Dismal Swamp,
W79-02751 2H

POLLUTANT IDENTIFICATION
Detection of Water Pollutants by Laser Excited Resonance Raman Spectroscopy; Pesticides and Fungicides,
W79-02576 5A

Investigation of Isothiocyanatopentaaquochromium (III) as a Reagent for the Separation and Identification of Nanogram Quantities of Mercury (I), Mercury (II), and Methylmercury (II),
W79-02589 5A

Determination of Alkylmercury Compounds in Lake Sediments by Steam Distillation-Flameless Atomic Absorption,
W79-02642 5A

Characterization and Evaluation of Wastewater, United States Steel Corporation, Homestead Wheel and Axle Plant, McKees Rocks, Pennsylvania, August 21-28, 1975.
W79-02791 5G

Characterization and Evaluation of Wastewater Sources, United States Steel Corporation, Duquesne Plant, Pittsburgh, Pennsylvania, February 26-March 6, 1976.
W79-02793 5G

Analysis and Characterization of Trace Elements in Shale Oil Products by Instrumental Neutron Activation Analysis,
W79-02822 5A

Rapid Method for Determining Concentrations of Bayer 73 in Water During Lampricide Treatments,
W79-02891 5A

Application of High Performance Liquid Chromatography to the Study of Dissolved Organic Phosphorus Compounds Released by Algae,
W79-02906 5A

Chromatographic Studies of Dissolved Organic Phosphorus Compounds Resulting from Algal Cultures,
W79-02907 5A

Chemical Analysis of Mine Drainage Waters,
W79-02918 5A

POLLUTANTS
Long-Term Aspects of the Environmental Burden from Energy Production: CO2 and 3H, (In German),
W79-02855 5A

POLLUTION ABATEMENT
Upgrading Diary Production Facilities to Control Pollution -- In-Plant Control of Waste,
W79-02518 5G

Mineral Mining and Processing Point Source Category Effluent Guidelines and Standards: Phosphate Rock Mining,
W79-02534 5G

Dissolved-Oxygen Regimen of the Willamette River, Oregon, Under Conditions of Basinwide Secondary Treatment,
W79-02657 5G

POLLUTION FORECAST
Pollution Forecast in Streams,
W79-02831 5B

POLYAROMATIC
Bioaccumulation Potential of Polycyclic Aromatic Hydrocarbons in Daphnia Pulex,
W79-02982 5C

POLYARTHRA VULGARIS
Culturing and Ecology Studies of the Rotifer Polyarthra Vulgaris,
W79-02624 5C

POLYCHLORINATED BIPHENYL
Utilisation Du Protozoaire Cilie Colpidium Campylum Pour La Mesure De La Toxicite Et De L'Accumulation Des Micropollutant: Analyse Critique et Applications (Use of the Ciliated Protozoa Colpidium Campylum for the Measurement of Toxicity and Accumulation of Micropollutants: Analysis and Application),
W79-02894 5C

POLYCHLORINATED BIPHENYLS
PCBS Water Elimination/Reduction Technology and Associated Costs, Manufacturers of Electrical Capacitors and Transformers,
W79-02800 5D

POLYCHLORINATED BIPHENYLS

Productivity of Ospreys in Connecticut-Long Island Increases as DDE Residue Declines,
W79-02886 5C

PCBs Involvement in the Pulp and Paper Industry,
W79-02920 5B

Polychlorinated Biphenyls: Transfer from Microparticulates to Marine Phytoplankton and the Effects on Photosynthesis,
W79-02978 5C

POLYMERS
Polymer Coagulation of Humic Acid Waters,
W79-02715 5D

POLYSACCHARIDE SYNTHESIS
Effects of Salinity on Synthesis of DNA, Acidic Polysaccharide, and Growth in the Blue-Green Alga, Gomphosphaeria Aponina,
W79-02981 5C

POPULATION DENSITY
The Development of Flood-Potential Index Maps for Pennsylvania,
W79-02598 4A

PORE WATER
A Rapid and Precise Method for Determining Sulfate in Seawater, Estuarine Waters, and Sediment Pore Water,
W79-02846 2K

POROUS MEDIA
A Three-Dimensional Galerkin Finite Element Model for the Analysis of Contaminant Transport in Variably Saturated Porous Media, User's Guide,
W79-02838 5B

PORTLAND CEMENTS
Elimination of Water Pollution by Recycling Cement Plant Kiln Dust,
W79-02509 5D

POTABLE WATER
Some Impacts of Safe Drinking Water Standards on Rural Water Systems,
W79-02522 5G

Consumer Notification - Public Awareness or the Smoking Pistol,
W79-02545 5G

POTAMOLOGY
Suspended Sediment and Bed Material Studies on the Lower Mississippi River,
W79-02703 8B

POTASSIUM COMPOUNDS
The Use of Potassium Permanganate (KMNO4) in Fisheries; A Literature Review,
W79-02585 5G

POTASSIUM PERMANGANATE
The Use of Potassium Permanganate (KMNO4) in Fisheries; A Literature Review,
W79-02585 5G

Toxicity of Selected Chemicals to the Fairy Shrimp, Streptocephalus Seali, Under Laboratory and Field Conditions,
W79-02971 5C

POTENTIAL WATER SUPPLY
Preliminary Evaluation of the Water-Supply Potential of the Spring-River System in Weeki Wachee Area and the Lower Withlacoochee River, West-Central Florida,
W79-02655 4B

POWERPLANT SITE SELECTION
Probabilistic Analysis of Water Availability in Power Plant Site Selection,
W79-02834 3E

POWERPLANTS
Impact of Flow Regulation and Power Plant Effluents on the Flow and Temperature Regimes of the Chattahochee River -- Atlanta to Whitesburg, Georgia,
W79-02648 5B

Long-Term Aspects of the Environmental Burden from Energy Production: CO2 and 3H, (In German),
W79-02855 5A

PRE-IMPOUNDMENT
Preimpoundment Study Little Black Creek Drainage Basn Black Creek Watershed Bulloch County, Georgia,
W79-02635 5C

PRECIPITATION
Surface Water Resources of Northwest Florida,
W79-02727 2E

PRECIPITATION (ATMOSPHERIC)
Normal Precipitation in West Virginia,
W79-02984 2B

PRECIPITATION GAGES
Accuracy of Canadian Snow Gage Measurements,
W79-02681 2B

PREDICTIVE MODEL
The Calibration of a Phytoplankton Growth Model Using Batch Culture Data,
W79-02878 5C

PRESERVATION
Neglected Marine Sanctuary Law is Showing Signs of Life,
W79-02540 6E

PRIMARY PRODUCTION
Polychlorinated Biphenyls: Transfer from Microparticulates to Marine Phytoplankton and the Effects on Photosynthesis,
W79-02978 5C

PRIMARY PRODUCTIVITY
Plant Biomass and Net Primary Production Along a Flood-Frequency Gradient in the Streamside Forest,
W79-02761 2I

Plant Standing Crop and Productivity Relations in a Scirpus-Equistum Wetland,
W79-02936 2I

The Relationship Between Net Primary Production and Accumulation for a Peatland in Southeastern Manitoba,
W79-02938 5C

Seasonal Phytoplankton Production in the Western English Channel 1964-1974,
W79-02963 5C

Nutrient Regeneration by Zooplankton During a Red Tide off Peru, with Notes on Biomass and Species Composition of Zooplankton,
W79-02975 5C

PROBABILITY
An Oilspill Risk Analysis for the Mid-Atlantic (Proposed Sale 49) Outer Continental Shelf Lease Area,
W79-02661 5G

Probabilistic Analysis of Water Availability in Power Plant Site Selection,
W79-02834 3E

PRODUCTIVITY
An Overview of Nutrient Cycling Research at Coweeta Hydrologic Laboratory,
W79-02571 4D

Biological Productivity in Two Georgia River Swamps,
W79-02720 2H

Energy Flux in a Tidal Creek Draining an Irregularly Flooded Juncus Marsh,
W79-02748 2L

Salt Marsh Plant Geratology,
W79-02932 2I

The Productivity of a Range of Blanket Bog Vegetation Types in the Northern Pennines,
W79-02945 2I

Nutrient Limitations to Plant Production in Two Tundra Communities,
W79-02947 2I

PRODUCTIVITY SILVICULTURE
Simulation of Potential Effects of Forest Utilization on the Nitrogen Cycle in Different Southeastern Ecosystems,
W79-02573 4D

PROGRAMMABLE CALCULATORS
Linear Ground-Water Flow, Flood-Wave Response Program for Programmable Calculators,
W79-02651 2F

PROJECTS
Weather Modification Activities in Texas, 1974-77,
W79-02699 3B

PROTECTION
Neglected Marine Sanctuary Law is Showing Signs of Life,
W79-02540 6E

PROTOCOCCACEAE CHLORELLA
The Use of the Protococcaceae for Purifying Waste Water (Primeniye Protokokkovykh Vodorosley Dkya Ochiski Stochnykh Vod),
W79-02797 5D

PROTOZOA
Use of Commensal Protozoa as Biological Indicators of Water Quality and Pollution,
W79-02643 5C

Utilisation Du Protozoaire Cilie Colpidium Campylum Pour La Mesure De La Toxicite Et De L'Accumulation Des Micropollutant: Analyse Critique et Applications (Use of the Ciliated Protozoa Colpidium Campylum for the Measurement of Toxicity and Accumulation of Micropollutants: Analysis and Application),
W79-02894 5C

PUBLIC HEALTH
An Assessment of the Occurrence of Human Viruses in Long Island Aquatic Systems,
W79-02584 5C

Hazardous Waste Disposal Damage Reports, Document No. 3,
W79-02792 5E

Acumulacion Y Effectos Histopatologicos Del Mercurio Inorganico Y Organico En La Lisa (Mugil Auratus Risso) (Accumulation and Histopathological Effects of Inorganic and Organic Mercury on the Mullet),
W79-02958 5C

Acumulacion and Efectos Histopatologicos Del Cadmio Y El Mercurio En El Sapo (Halobatrachus Didactylus) (Accumulation and Histopathological Effect of Cadmium and of Mercury on the Sapo),
W79-02959 5C

PUBLIC UTILITIES
Some Impacts of Safe Drinking Water Standards on Rural Water Systems,
W79-02522 5G

Consumer Notification - Public Awareness or the Smoking Pistol,
W79-02545 5G

PUEBLO INDIANS WATER RIGHTS
Pueblo Water Rights on the Upper Rio Grande,
W79-02818 6E

PULP AND PAPER INDUSTRY
PCBs Involvement in the Pulp and Paper Industry,
W79-02920 5B

PULP WASTES
Determination of the Practical Value of Toxic Loadings,
W79-02536 5C

Consequences of Leaching from Pulp and Paper Mill Landfill Operations.
W79-02591 5B

The Effect of Temperature on Treatment Plant Performance and Related Temperature Studies,
W79-02618 5D

Paper Pulp Compounds Containing Active Sludge,
W79-02941 5D

PUMPING
Estimated Agricultural Ground-Water Pumpage in Parts of Fresno, Kings, and Madera Counties, San Joaquin Valley, California, 1974-77,
W79-02658 4B

PYRENE
Bioaccumulation Potential of Polycyclic Aromatic Hydrocarbons in Daphnia Pulex,
W79-02982 5C

RADIO ACTIVE SELENIUM
Selenium Metabolism in the Marine Phytoplankters Tetraselmis Tetrathele and Dunaliella Minuta,
W79-02979 5C

RADIOACTIVE TRACERS
Use of Neutron Activatable Tracers for Simulating Water and Chemical Flow Through Porous Media,
W79-02814 5B

RADIOACTIVE WASTES
An Appraisal of the Hydrogeological Processes Involved in Shallow Subsurface Radioactive Waste Management in Canadian Terrain,
W79-02926 5B

RAINFALL
Characteristics and Filtering of Noise in Linear Hydrological Systems,
W79-02914 7C

RAINFALL ACIDITY
Simulation of Nutrient Loss from Soils Due to Rainfall Acidity,
W79-02730 5B

RAINFALL-RUNOFF RELATIONSHIPS
A Rainfall-Runoff Modeling Procedure for Improving Estimates of T-Year (Annual) Floods for Small Drainage Basins,
W79-02652 2E

REACH (STREAMS)
Unsteady Streamflow Simulation Using a Linear Implicit Finite-Difference Model,
W79-02644 2E

REASONABLE USE
Establishing Liability for Damage Resulting from the use of Underground Percolating Water: South-Southwest Industries v. Friendswood Development Company,
W79-02555 6E

Bohemian Brethren Presbyterian Church v. Greek Archdiocesan Cathedral of the Holy Trinity (Runoff Damage Resulting from Grading of Adjoining Property).
W79-02566 6E

RECREATION
Aquatic Resources and Recreation Behavior,
W79-02641 6B

Recreation, (Colorado River Basin),
W79-02739 6B

Social Impacts from Wildlife Within the Columbia Basin Irrigation District,
W79-02839 6B

RECREATION DEMAND
Recreation, (Colorado River Basin),
W79-02739 6B

RECYCLING
Waste Disposal Study, Evaluation of Methods to Recover Reusable Chemicals from Evaporated Photowastes,
W79-02809 5E

RED RIVER BASIN
Water Resources Data for Oklahoma, Water Year 1977--Volume 2. Red River Basin.
W79-02665 7C

RED SEA
Africa A. Wet Formations of the African Red Sea Coast,
W79-02772 2L

RED TIDE
Nutrient Regeneration by Zooplankton During a Red Tide off Peru, with Notes on Biomass and Species Composition of Zooplankton,
W79-02975 5C

REFRACTORY COMPOUNDS
Effects of Wastewater Process Operation on Organics in Potable Water Supplies,
W79-02815 5D

REGIONAL ANALYSIS
Methods for Estimating the Magnitude and Frequency of Floods in Arizona,
W79-02649 2E

Resource Demands for Energy Development in the Yellowstone River Basin,
W79-02726 6D

Carrying Capacity and Planning, (Colorado River Basin),
W79-02741 6B

Institutional Arrangements for Area-Wide Quality Planning and Management, Section 208 Applied in Three Metropolitan Areas of the Great Lakes,
W79-02819 5G

REGRESSION ANALYSIS
Methods for Estimating the Magnitude and Frequency of Floods in Arizona,
W79-02649 2E

REGULATED FLOW
Impact of Flow Regulation and Power Plant Effluents on the Flow and Temperature Regimes of the Chattahochee River -- Atlanta to Whitesburg, Georgia,
W79-02648 5B

REGULATION
Emergency Suspension Procedures for Outer Continental Shelf Oil and Gas Operations,
W79-02532 5G

Rules and Procedures for Application for Coastal Construction Permits.
W79-02559 6E

Youghiogheny River-Designation as a Wild River; Mining of Minerals; Rules Governing Use and Development; Funds to Purchase Property
W79-02564 6E

RELATIVE RIGHTS
Bohemian Brethren Presbyterian Church v. Greek Archdiocesan Cathedral of the Holy Trinity (Runoff Damage Resulting from Grading of Adjoining Property).
W79-02566 6E

REMEDIES
The Water Quality Improvement Act of 1970, The 1972 Amendments and State Antipollution Laws,
W79-02542 5G

California's Program for Dealing with the Drought,
W79-02544 6E

Subsidence of Land Caused by Withdrawal of Percolating Water is Actionable on the Theories of Negligence and Nuisance in Fact,
W79-02550 6E

Surface Water Flooding in Urban Areas: Rights and Remedies Under the Common Enemy Doctrine,
W79-02552 6E

REMOTE SENSING
Remote Sensing of Surface Soil Moisture,
W79-02682 7B

Satellite Observations of Calcium Carbonate Precipitations in the Great Lakes,
W79-02685 7B

Coastal Wetlands: Role of Remote Sensing,
W79-02747 7B

Applications of Remotely Sensed Data to Wetland Studies,
W79-02749 7B

REMOVAL EFFICIENCY
Replacement of Metallic Impurities from Water by Metal Beds,
W79-02603 5F

RESEARCH
Water Resources Research Support Program 1978-1979,
W79-02928 6E

RESEARCH AND DEVELOPMENT
Un Nouvel Aspirateur Sous-Marins A Air Comprime (A New Submarine Suction-Sampler, Using Compressed Air),
W79-02897 7B

RESEARCH EQUIPMENT
Un Nouvel Aspirateur Sous-Marins A Air Comprime (A New Submarine Suction-Sampler, Using Compressed Air),
W79-02897 7B

RESEARCH FACILITIES
The Oxford University Water Cavitation Tunnel. Description and Operating Procedures,
W79-02860 8B

RESERVOIR DRAWDOWN
Effects of Water Drawdown on the Fauna in Small Cold-Water Reservoirs,
W79-02830 4A

RESERVOIR OPERATION
Transit Losses and Traveltimes of Reservoir Releases along the Arkansas River from Pueblo Reservoir to John Martin Reservoir, Southeastern Colorado,
W79-02659 4A

RESERVOIR OPERATION

Effects of Water Drawdown on the Fauna in Small Cold-Water Reservoirs,
W79-02830 4A

Multiobjective Trade-Off Risks in Reservoir Operation,
W79-02915 4A

RESERVOIR OPERATIONS
Effect of Subzero Temperature in Concrete on the Nature of Operations of High Concrete Dams,
W79-02690 8F

RESERVOIR RELEASES
Transit Losses and Traveltimes of Reservoir Releases along the Arkansas River from Pueblo Reservoir to John Martin Reservoir, Southeastern Colorado,
W79-02659 4A

Effects of Water Drawdown on the Fauna in Small Cold-Water Reservoirs,
W79-02830 4A

RESERVOIRS
The Effect of Hypolimnion Reservoir Releases on Fish Distribution and Species Diversity,
W79-02670 6G

Lake Process Models Applied to Reservoir Management,
W79-02716 5A

Investigation of Natural Sealing Processes in Irrigation Canals and Reservoirs,
W79-02905 4A

RESISTANCE
The Effect of Arsenic on the Thermal Tolerance and Survival of Newly Hatched Muskellunge Fry (Esox Masquinongy),
W79-02587 5C

RESOURCE ALLOCATION
The Seabed Negotiation and the Law of the Sea Conference -- Ready for a Divorce,
W79-02549 6E

RESOURCE BASE
Aquatic Resources and Recreation Behavior,
W79-02641 6B

RESOURCES DEVELOPMENT
Environmental Assessment of the Alaskan Continental Shelf. Interim Synthesis: Beaufort/Chukchi.
W79-02608 5C

Species, Habitats and Processes Sensitive to OCS Development,
W79-02609 5C

Effects of Gravel Mining and Construction of Gravel Islands and Causeways.
W79-02612 5C

Environmental Hazards to Offshore Operations.
W79-02613 5C

Values and Choices in the Development of the Colorado River Basin.
W79-02732 6B

RESPIRATION
Field Estimates of Aquatic Plant Respiration and its Application of Stream Dissolved Oxygen Budgets,
W79-02816 5C

RETAINING WALLS
Evaluation of the Corrosion Resistance of Alternate Revetment Wire Fabric Materials in the Lower Mississippi River,
W79-02872 8G

RETURN FLOW
Evaluation of Measures for Controlling Sediment and Nutrient Losses from Irrigated Areas,
W79-02501 5G

Identification and Initial Evaluation of Irrigation Return Flow Models,
W79-02510 6A

'Best Management Practices' for Salinity Control in Grand Valley,
W79-02521 5G

Western Water Laws and Irrigation Return Flow,
W79-02575 5G

Selected Irrigation Return Flow Quality Abstracts 1976, Sixth Annual Issue,
W79-02580 10C

Evaluation of Irrigation Methods for Salinity Control in Grand Valley,
W79-02594 5G

Implementation of Agricultural Salinity Control Technology in Grand Valley,
W79-02617 5G

Alternative Policies for Controlling Nonpoint Agricultural Sources of Water Pollution,
W79-02619 5G

Integrating Desalination and Agricultural Salinity Control Alternatives,
W79-02629 5G

Las Vegas Valley Water Budget: Relationship of Distribution, Consumptive Use, and Recharge to Shallow Groundwater,
W79-02728 5G

Soil Morphologic and Hydraulic Changes Associated with Wastewater Irrigation,
W79-02817 5G

REVERSE OSMOSIS
Development of a 50,000 GPD Seawater Reverse Osmosis Pilot Plant Based on Cellulose Triacetate Hollow Fine Fibers,
W79-02676 3A

Anaerobic Digestion and Reverse Osmosis Separation for the Treatment of Domestic Liquid Waste,
W79-02826 5D

RICE
Resistances to Water Transport in Rice Plants,
W79-02986 2I

RIFTING
Rifting in the Okavango Delta,
W79-02934 2H

RIO GRANDE RIVER (NM)
Pueblo Water Rights on the Upper Rio Grande,
W79-02818 6E

RIPARIAN LAND
Equal Footing Doctrine does not Require Application of Federal Common Law to Resolve Ownership of Land Underlying Navigable Waterways which are not Interstate Boundaries,
W79-02551 6E

RIPARIAN PLANTS
Cattle, Wildlife, and Riparian Habitats in the Western Dakotas,
W79-02760 2I

RIPARIAN RIGHTS
State Law Controls Title to Alluvial Formations Even Though Original Title is Based on Equal-Footing Doctrine or Federal Grant,
W79-02541 6E

In RE Water Rights of the Cibolo Creek Watershed (Landowner's Claim of Equitable Riparian Water Rights Denied).
W79-02567 6E

RIPRAP
Laboratory Tests of Concrete Aggregate and Riprap for New Lock and Dam No. 26,
W79-02854 8F

RISKS
An Economic Analysis of Alternative Federal Flood Damage Assistance Programs.
W79-02824 6F

Systematic Assessment of Uncertainties in an Environment Impact Statement,
W79-02882 6G

Uncertainties of Karstic Water Resources Systems,
W79-02883 2F

RIVER BASIN DEVELOPMENT
Values and Choices in the Development of the Colorado River Basin.
W79-02732 6B

Physical Setting, (Colorado River Basin),
W79-02733 4A

Policy Goals and Values in Historical Perspective, (Colorado River Basin),
W79-02736 6B

Energy Resources Development, (Colorado River Basin),
W79-02737 3E

Recreation, (Colorado River Basin),
W79-02739 6B

RIVER BASINS
Politics of Water Allocation, (Colorado River Basin),
W79-02735 6E

RIVER POLLUTION
Pollution Forecast in Streams,
W79-02831 5B

RIVERSIDE COUNTY
Water Wells and Springs in Palo Verde Valley, Riverside and Imperial Counties, California,
W79-02647 7C

ROCK EXCAVATION
Review and Analysis of Blasting and Vibrations at Bankhead Lock,
W79-02701 8H

ROCK MECHANICS
Results of In Situ Modulus of Deformation Test, Cannelton Lock and Dam,
W79-02710 8E

ROCK PROPERTIES
Results of In Situ Modulus of Deformation Test, Cannelton Lock and Dam,
W79-02710 8E

ROCKFILL DAMS
Thermal Regime of Earth-Rock Dams Constructed in the Far North.
W79-02694 8D

ROCKS
Laboratory Tests of Concrete Aggregate and Riprap for New Lock and Dam No. 26,
W79-02854 8F

ROCKY SHORE
An Exposure Scale for Marine Shores in Western Norway,
W79-02964 5B

ROOT GROWTH
Root Growth in Cores Formed from Fragipan and B2 Horizons of Hobson Soil,
W79-02592 2G

ROOT SYSTEMS
Root Growth in Cores Formed from Fragipan and B2 Horizons of Hobson Soil,
W79-02592 2G

ROOTED AQUATIC PLANTS
Plant Standing Crop and Productivity Relations in a Scirpus-Equistum Wetland,
W79-02936 2I

ROTATING BIOLOGICAL CONTRACTORS
Effects of Wastewater Process Operation on Organics in Potable Water Supplies,
W79-02815 5D

ROTENONE
Methodology Developed for Assessment of Fish and Macroinvertebrate Communities in the New River, Virginia,
W79-02606 5C

ROTIFERS
Culturing and Ecology Studies of the Rotifer Polyarthra Vulgaris,
W79-02624 5C

RUNOFF
Effect of Tillage Systems on Runoff Losses of Nutrients, A Rainfall Simulation Study,
W79-02680 4C

Soil and Water Loss from Conservation Tillage Systems,
W79-02852 3F

Characteristics and Filtering of Noise in Linear Hydrological Systems,
W79-02914 7C

SABKHAS
Isotope Hydrology of Inland Sabkhas in the Bardawil Area, Sinai,
W79-02841 2H

SALINE LAKES
Age, Growth, and Food Habits of the Fathead Minnow, Pimephales Promelas, in North Dakota Saline Lakes,
W79-02590 2H

SALINE WATER
Physical Setting, (Colorado River Basin),
W79-02733 4A

SALINE WATER INTRUSION
Preliminary Evaluation of the Water-Supply Potential of the Spring-River System in Weeki Wachee Area and the Lower Withlacoochee River, West-Central Florida,
W79-02655 4B

SALINITY
Evaluation of Measures for Controlling Sediment and Nutrient Losses from Irrigated Areas,
W79-02501 5G

Selected Irrigation Return Flow Quality Abstracts 1976, Sixth Annual Issue,
W79-02580 10C

Factors Affecting Temperature and Salinity Conditions on a Scottish Salt-Marsh, with Notes on the Ecology of Sphaeroma Rugicauda (Leach),
W79-02754 2L

Dissolution Potential of Surficial Mancos Shale and Alluvium,
W79-02827 5B

Osmotic Balance and Respiration in the Hermit Crab, Pagurus Bernhardus, Exposed to Fluctuating Salinities,
W79-02957 5C

Interactions of Methylmercury, Cadmium, and Salinity on Regeneration in the Fiddler Crabs Uca Pugilator, U. Pugnax and U. Minax,
W79-02974 5C

Effects of Salinity on Synthesis of DNA, Acidic Polysaccharide, and Growth in the Blue-Green Alga, Gomphosphaeria Aponina,
W79-02981 5C

Responses of Bermudagrass to Salinity,
W79-02993 3C

SALINITY CONTROL
'Best Management Practices' for Salinity Control in Grand Valley,
W79-02521 5G

Evaluation of Irrigation Methods for Salinity Control in Grand Valley,
W79-02594 5G

Implementation of Agricultural Salinity Control Technology in Grand Valley,
W79-02617 5G

Integrating Desalination and Agricultural Salinity Control Alternatives,
W79-02629 5G

SALT MARSHES
The Influence of Environmental Factors on the Distribution, Composition, and Transport of Microbial Biomass and Suspended Material in a Salt Marsh Ecosystem,
W79-02673 5B

Environmental Factors Limiting the Distribution of Five Plant Species on Salt Marshes of Island Beach, New Jersey,
W79-02678 2L

An Ecological Study of Epipsammic Diatoms from Sediments Associated with Juncus Roemerianus in a Northwest Florida Salt Marsh,
W79-02722 2L

Linear Programming Model to Quantify Economic, Environmental and Social Values of a Tidal Marsh,
W79-02723 6B

Bird Use of Anaheim Bay: A Southern California Salt Marsh,
W79-02724 2L

The Effect of Salinity and Tidal Inundation on Photosynthesis and Plant Water Relations of Spartina Alteniflora Loisel,
W79-02725 2I

Salt Marshes of the Alaska Pacific Coast,
W79-02743 2L

The Salt Marsh Vegetation of China Poot Bay, Alaska,
W79-02744 2L

Factors Affecting Temperature and Salinity Conditions on a Scottish Salt-Marsh, with Notes on the Ecology of Sphaeroma Rugicauda (Leach),
W79-02754 2L

Growth, Abundance and Distribution of Larval Tabanids in Experimentally Fertilized Plots on a Massachusetts Salt Marsh,
W79-02755 2L

Physiography; Wet Coastal Ecosystems,
W79-02764 2L

Soils of Marine Marshes,
W79-02766 2G

Salt-Marsh Animals: Distributions Related to Tidal Flooding, Salinity and Vegetation,
W79-02767 2I

Plant and Animal Communities of Pacific North American Salt Marshes,
W79-02770 2L

Tidal Salt-Marsh and Mangal Formations of Middle and South America,
W79-02771 2L

Africa A. Wet Formations of the African Red Sea Coast,
W79-02772 2L

Africa B. The Remainder of Africa: Wet Coastal Ecosystems,
W79-02773 2L

Mangal and Coastal Salt-Marsh Communities in Australia,
W79-02777 2L

Human Uses of Salt Marshes,
W79-02779 2L

Denitrification in a Massachusetts Salt Marsh,
W79-02812 5A

The Ecology of Palaemonetes Pugio in a Southeastern Salt Marsh Ecosystem with Particular Emphasis on Production and Trophic Relationships,
W79-02821 2L

Pools of Nitrogen in a Georgia Salt Marsh,
W79-02899 5C

Salt Marsh Plant Geratology,
W79-02932 2I

SALT TOLERANCE
The Effect of Salinity and Tidal Inundation on Photosynthesis and Plant Water Relations of Spartina Alteniflora Loisel,
W79-02725 2I

Responses of Bermudagrass to Salinity,
W79-02993 3C

SALTS
The Use of Potassium Permanganate (KMNO4) in Fisheries; A Literature Review,
W79-02585 5G

Dissolution Potential of Surficial Mancos Shale and Alluvium,
W79-02827 5B

SAMPLING
Methodology Developed for Assessment of Fish and Macroinvertebrate Communities in the New River, Virginia,
W79-02606 5C

Techniques for Sampling and Analyzing the Marine Macrobenthos,
W79-02627 5A

A Device to Collect Supernatant Water from Measurement of the Flux of Dissolved Compounds Across Sediment Surfaces,
W79-02686 5A

Environmental Parameters of the Tennessee River in Alabama: II. Physical, Chemical, and Biological Parameters,
W79-02781 5A

A Chemical and Biological Evaluation of Three Mine Drainage Treatment Plants,
W79-02794 5D

SAMPLING

A New Method for Collecting Water Samples from Beneath the Ice,
W79-02845 7B

Un Nouvel Aspirateur Sous-Marins A Air Comprime (A New Submarine Suction-Sampler, Using Compressed Air),
W79-02897 7B

SAN JOAQUIN VALLEY (CALIF)
Estimated Agricultural Ground-Water Pumpage in Parts of Fresno, Kings, and Madera Counties, San Joaquin Valley, California, 1974-77,
W79-02658 4B

SAN PEDRO RIVER WATERSHED (ARIZ)
A Multiobjective Approach to Managing a Southern Arizona Watershed,
W79-02881 4D

SANDSTONES
Spray Grouting: Summary of Research, Development, Utilization, and Future Uses,
W79-02863 8F

SASKATCHEWAN GLACIER
Glacier Surveys in Alberta - 1975,
W79-02925 2C

SCARCE WATER
Factual Inputs for Allocation Decisions Concerning Scarce Water Resources,
W79-02731 6B

SCOTLAND
Factors Affecting Temperature and Salinity Conditions on a Scottish Salt-Marsh, with Notes on the Ecology of Sphaeroma Rugicauda (Leach),
W79-02754 2L

SEA CUCUMBER
Biological Availability of Pollutants to Marine Organisms,
W79-02628 5C

SEA ICE
Preferred Crystal Orientations in the Fast Ice Along the Margins of the Arctic Ocean,
W79-02850 2C

SEA URCHIN
Biological Availability of Pollutants to Marine Organisms,
W79-02628 5C

SEA WATER
A Rapid and Precise Method for Determining Sulfate in Seawater, Estuarine Waters, and Sediment Pore Water,
W79-02846 2K

Fine Structure Instabilities Induced by Double Diffusion in the Shelf/Slope Water Front,
W79-02851 2L

SEALANTS
Nonmetallic Waterstops,
W79-02712 8F

SEALING
Investigation of Natural Sealing Processes in Irrigation Canals and Reservoirs,
W79-02905 4A

SEASONAL
Parasites and Related Pathology of the Cottontail Rabbit (Sylvilagus floridanus) in central Pennsylvania,
W79-02833 5C

SEDIMENT TRANSPORT
Hydraulics and Dynamics of New Corpus Christi Pass, Texas: A Case History, 1972-73,
W79-02707 8B

Assessment and Implementation of In-Stream Value Studies for the Northern Great Plains,
W79-02709 4A

SEDIMENTARY PETROLOGY
High-Magnesium Calcite Ooids from the Great Barrier Reef,
W79-02999 2L

SEDIMENTATION
Soils of Marine Marshes,
W79-02766 2G

SEDIMENTS
Evaluation of Measures for Controlling Sediment and Nutrient Losses from Irrigated Areas,
W79-02501 5G

Suspended Sediment and Bed Material Studies on the Lower Mississippi River,
W79-02703 8B

Dissolution Potential of Surficial Mancos Shale and Alluvium,
W79-02827 5B

An Inexpensive and Easily Fabricated Sampler for Colecting Sediment Cores to Measure EH Potentials,
W79-02917 7B

Contribution of Chronic Petroleum Inputs to Narragansett Bay and Rhode Island Sound Sediments,
W79-02942 5B

SEEDS
The Seed Banks of Prairie Glacial Marshes,
W79-02933 2I

SEEPAGE CONTROL
Developing Procedures for Predicting Effectiveness in Seepage Control,
W79-02820 4A

Investigation of Natural Sealing Processes in Irrigation Canals and Reservoirs,
W79-02905 4A

SEEPAGE WATER
Investigation of Natural Sealing Processes in Irrigation Canals and Reservoirs,
W79-02905 4A

SEICHE STRUCTURE
Seiche Structure and Vertical Mixing Below the Epilimnion in Small Lakes,
W79-02813 5C

SELENASTRUM CAPRICORNUTUM
Effects of Temperature on Growth Constants of Selenastrum Capricortnutum,
W79-02876 5C

SELENIUM
Concentrations of Ten Heavy Metals in Some Selected Lake Powell Game Fishes,
W79-02582 5B

Accelerated Rate of Albinism in Channel Catfish Exposed to Metals,
W79-02967 5C

Acute Toxicity of Mercury and Selenium to Crassostrea Gigas Embryos and Cancer Magister Larvae,
W79-02973 5C

Selenium Metabolism in the Marine Phytoplankters Tetraselmis Tetrathele and Dunaliella Minuta,
W79-02979 5C

SEMIPERMEABLE MEMBRANES
Anaerobic Digestion and Reverse Osmosis Separation for the Treatment of Domestic Liquid Waste,
W79-02826 5D

SENTINEL GLACIER
Principal Components Analysis of Glacier-Climatological Data for Sentinel Glacier, British Columbia,
W79-02927 2C

SEPARATION TECHNIQUES
Bilge Water Treatment with a Tabular Ultrafiltration System,
W79-02502 5D

Elimination of Water Pollution by Recycling Cement Plant Kiln Dust,
W79-02509 5D

SEPTIC TANKS
A Field Study of Treatment vs. Depth of Sand Fill in a Mound System,
W79-02604 5D

SERE
Nutrients, Toxins, and Water in Terrestrial and Aquatic Ecosystems Treated with Sewage Plant Effluents - Final Report of the Upland Recharge Program,
W79-02638 5D

SEVEN ESTUARY (ENGLAND)
The Presence of Pollutant Hydrocarbons in Estuarine Epipelic Diatom Populations,
W79-02998 5C

SEWAGE DISPOSAL
Chemical Sewage Sludge Disposal on Land (Lysimeter Studies) Volume II,
W79-02924 5E

SEWAGE DISTRICTS
Evaluation of Proposed NPDES Limitations for Homestake Mining Company and Lead-Deadwood Sanitary District No. 1.
W79-02790 5G

SEWAGE EFFLUENTS
Water Quality in the Sugar Creek Basin, Bloomington and Normal, Illinois.
W79-02660 5B

A Fresh Water Waste Recycling-Aquaculture System,
W79-02759 5D

Reeds Control Eutrophication of Balaton Lake,
W79-02954 5G

SEWAGE SLUDGE
Biological Availability of Pollutants to Marine Organisms,
W79-02628 5C

Chemical Sewage Sludge Disposal on Land (Lysimeter Studies) Volume II,
W79-02924 5E

SEWAGE TREATMENT
The U-Tube for Water Aeration,
W79-02506 5D

A Report on the Concentration, Distribution and Impact of Certain Trace Metals from Sewage Treatment Plans on the Chesapeake Bay,
W79-02511 5B

Electrochemical Biocide,
W79-02514 5D

Concerned Citizens for Orderly Progress v. Commonwealth of Pennsylvania, Dept. of Envi-

ronmental Resources (Sewage Facility Construction Permit Upheld).
W79-02569 6E

An Assessment of the Occurrence of Human Viruses in Long Island Aquatic Systems,
W79-02584 5C

Nutrients, Toxins, and Water in Terrestrial and Aquatic Ecosystems Treated with Sewage Plant Effluents - Final Report of the Upland Recharge Program,
W79-02638 5D

SEWERS
Concerned Citizens for Orderly Progress v. Commonwealth of Pennsylvania, Dept. of Environmental Resources (Sewage Facility Construction Permit Upheld).
W79-02569 6E

SHAEROTILUS NATANS
Methodology Developed for Assessment of Fish and Macroinvertebrate Communities in the New River, Virginia,
W79-02606 5C

SHALE OIL PRODUCTS
Analysis and Characterization of Trace Elements in Shale Oil Products by Instrumental Neutron Activation Analysis,
W79-02822 5A

SHALLOW WELLS
Dug-Wells, Dug-Cum-Bore Wells, and Tubewells,
W79-02994 4B

SHELLFISH
A Report on the Concentration, Distribution and Impact of Certain Trace Metals from Sewage Treatment Plans on the Chesapeake Bay,
W79-02511 5B

Financial Implications of Waste Management Systems for Shellfish Processing,
W79-02516 5G

SHEYENNE RIVER BASIN (ND)
Application of Five Methods for Measurement of Wildlife Vaue; Lower Sheyenne River Basin, North Dakota,
W79-02605 2I

SHIPS
Characterization of Product Tanker Slop Waters,
W79-02805 5B

SHRIMP
Environmental Studies of Kachemak Bay and Lower Cook Inlet, Volume VI: Food Habits of Shrimp in Kachemak Bay, Alaska,
W79-02780 2L

The Effects of Three Phthalate Esters on the Larval Development of the Grass Shrimp Palaemonetes Pugio (Holthuis),
W79-02786 5C

The Ecology of Palaemonetes Pugio in a Southeastern Salt Marsh Ecosystem with Particular Emphasis on Production and Trophic Relationships,
W79-02821 2L

Toxicity of Selected Chemicals to the Fairy Shrimp, Streptocephalus Seali, Under Laboratory and Field Conditions,
W79-02971 5C

SIBERIA (USSR)
Dam Design and Construction in the USSR's North and Siberia,
W79-02868 8D

SIGNAL DETECTION THEORY
Subjective Detection of Differences in Variance from Small Samples,
W79-02597 6A

SILICATES
Chemical Limnology of Georgian Bay, 1974,
W79-02923 5A

SIMULATION ANALYSIS
Unsteady Streamflow Simulation Using a Linear Implicit Finite-Difference Model,
W79-02644 2E

Linear Ground-Water Flow, Flood-Wave Response Program for Programmable Calculators,
W79-02651 2F

Solution of Coupled Nonlinear Ecosystem Equations,
W79-02714 2L

Simulation of Nutrient Loss from Soils Due to Rainfall Acidity,
W79-02730 5B

An Economic Analysis of Alternative Federal Flood Damage Assistance Programs.
W79-02824 6F

Application of Computer Waveform Matching to Monitoring of Hydrologic System Parameters,
W79-02836 7C

SINAI
Isotope Hydrology of Inland Sabkhas in the Bardawil Area, Sinai,
W79-02841 2H

SITES
Africa A. Wet Formations of the African Red Sea Coast,
W79-02772 2L

Africa B. The Remainder of Africa: Wet Coastal Ecosystems,
W79-02773 2L

Probabilistic Analysis of Water Availability in Power Plant Site Selection,
W79-02834 3E

SITES (WATER WELLS)
Well Field Site Selection Based on Geologic Criteria that Influence Ground Water Circulation in the Vicinity of Laramie, Wyoming,
W79-02912 4B

SLUDGE DIGESTION
Aerobic Digestion of Wastewater Sludge Under Low Temperature Conditions,
W79-02911 5D

SLUDGE DISPOSAL
Biological Availability of Pollutants to Marine Organisms,
W79-02628 5C

SLUDGE TREATMENT
A High-Efficiency Thermal Drying System,
W79-02675 5E

SMALL RURAL WATER SYSTEMS
Some Impacts of Safe Drinking Water Standards on Rural Water Systems,
W79-02522 5G

SMALL WATERSHEDS
A Rainfall-Runoff Modeling Procedure for Improving Estimates of T-Year (Annual) Floods for Small Drainage Basins,
W79-02652 2E

Transport of Agricultural Chemicals from Small Upland Piedmont Watersheds,
W79-02745 5B

SNOWFALL
Accuracy of Canadian Snow Gage Measurements,
W79-02681 2B

SOCIAL ASPECTS
Issues, Interests and Power: Environmental Politics in the Community Setting,
W79-02825 6B

SOCIAL IMPACTS
Social Impacts from Wildlife Within the Columbia Basin Irrigation District,
W79-02839 6B

SOCIAL OVERHEAD COSTS
Social Overhead Capital Costs of Irrigation Development in Washington State,
W79-02719 3F

SOCIAL VALUES
Policy Goals and Values in Historical Perspective, (Colorado River Basin),
W79-02736 6B

Issues, Interests and Power: Environmental Politics in the Community Setting,
W79-02825 6B

Social Impacts from Wildlife Within the Columbia Basin Irrigation District,
W79-02839 6B

SODIUM ARSENITE
The Effect of Arsenic on the Thermal Tolerance and Survival of Newly Hatched Muskellunge Fry (Esox Masquinongy),
W79-02587 5C

SODIUM BICARBONATE EXTRACTION
Transformations of Organic Phosphorus Substrates in Soils as Evaluated by NaHCO3 Extraction,
W79-02674 2K

SOIL ANALYSIS
Prediction of Hydraulic Conductivity Changes Using Soil Characteristics,
W79-02600 2G

SOIL CHEMICAL PROPERTIES
Chemical Characteristics of a Feedlot Soil Profile,
W79-02783 5B

SOIL CONSERVATION
Soil and Water Loss from Conservation Tillage Systems,
W79-02852 3F

SOIL EROSION
Effect of Tillage Systems on Runoff Losses of Nutrients, A Rainfall Simulation Study,
W79-02680 4C

Soil and Water Loss from Conservation Tillage Systems,
W79-02852 3F

SOIL FORMATION
Soils of Marine Marshes,
W79-02766 2G

SOIL MOISTURE
Remote Sensing of Surface Soil Moisture,
W79-02682 7B

SOIL MOISTURE METER
Evaluation of the MC-300A Soil Moisture Meter to Determine In-Place Moisture Content of Refuse at Land Disposal Sites,
W79-02503 5A

SOIL PHYSICS
Soil Morphologic and Hydraulic Changes Associated with Wastewater Irrigation,
W79-02817 5G

SOIL PROFILES
Chemical Characteristics of a Feedlot Soil Profile,
W79-02783 5B

SOIL PROPERTIES
Relations Between Soil Nutrients and Vegetation in Wetheaths. II. Nutrient Uptake by the Major Species in the Field and in Controlled Conditions,
W79-02939 2H

SOIL SURFACES
Remote Sensing of Surface Soil Moisture,
W79-02682 7B

SOIL TYPES
Soils of the Inter-Tidal Marshes of Dixie County, Florida,
W79-02757 2G

SOIL WATER
Empirical Equations for Some Soil Hydraulic Properties,
W79-02679 2G

SOIL WATER MOVEMENT
Developing Procedures for Predicting Effectiveness in Seepage Control,
W79-02820 4A

SOILS
Analysis of Consolidation of Earth and Rockfill Dams, Volume I, Main Text and Appendices A and B,
W79-02875 8D

SOLID WASTES
Consequences of Leaching from Pulp and Paper Mill Landfill Operations.
W79-02591 5B

Residual Management by Land Disposal, Proceedings of the Hazardous Waste Research Symposium.
W79-02810 5E

SOLVENT EXTRACTIONS
The Presence of Pollutant Hydrocarbons in Estuarine Epipelic Diatom Populations,
W79-02998 5C

SOUTH CAROLINA
Tidelands and the Public Trust: An Application for South Carolina.
W79-02539 6E

The Influence of Environmental Factors on the Distribution, Composition, and Transport of Microbial Biomass and Suspended Material in a Salt Marsh Ecosystem,
W79-02673 5B

Notes on the Flora of the Congaree River Floodplain, Richland County, South Carolina,
W79-02756 2I

SOUTHEAST U.S.
Dew-Monitoring Network in the Southeast,
W79-02853 7B

SOUTHEAST US
Transport of Agricultural Chemicals from Small Upland Piedmont Watersheds,
W79-02745 5B

SOUTHERN APPALACHIAN MOUNTAINS
Forest Service Studies of Soil and Nutrient Losses Caused by Roads, Logging, Mechanical Site Preparation, and Prescribed Burning in the Southeast,
W79-02572 5B

Nutrient Budgets for Undisturbed and Manipulated Hardwood Forest Ecosystems in the Mountains of North Carolina,
W79-02574 4D

SOUTHERN APPALACHIAN MOUNTAINS REGION
An Overview of Nutrient Cycling Research at Coweeta Hydrologic Laboratory,
W79-02571 4D

SOUTHWEST U.S.
Community Development, (Colorado River Basin),
W79-02740 6B

SOYBEANS
Soybean Yields and Lance Nematode Populations as Affected by Subsoiling, Fertility, and Nematicide Treatments,
W79-02989 3F

Effect of Irrigation, Lime, and Fertility Treatments on the yield and Chemical Composition of Soybeans,
W79-02991 3F

SPATIAL DISTRIBUTION
Spatial Changes in Waterfowl Habitat,
W79-02742 2H

SPATIAL STRATIFICATION
Seiche Structure and Vertical Mixing Below the Epilimnion in Small Lakes,
W79-02813 5C

SPECIES DIVERSITY
Techniques for Sampling and Analyzing the Marine Macrobenthos,
W79-02627 5A

Effects of Channelization of the Luxapalila River on Fish, Aquatic Invertebrates, Water Quality and Furbearers,
W79-02636 5C

SPECTROSCOPY
Detection of Water Pollutants by Laser Excited Resonance Raman Spectroscopy; Pesticides and Fungicides,
W79-02576 5A

SPRAY GROUTING
Spray Grouting: Summary of Research, Development, Utilization, and Future Uses,
W79-02863 8F

SPRAY IRRIGATED
Avian Communities and Habitat Components in Natural and Wastewater-Irrigated Environments,
W79-02601 5G

SPRING WATERS
Oklahoma Water Resources Board v. City of Lawton (Springwater Heated as Stream Water for Appropriation Permit Application),
W79-02561 6E

Bauer v. Prestwich (Use of Water on Land Makes it Appurtenant to the Land).
W79-02563 6E

SPRINGS
Preliminary Evaluation of the Water-Supply Potential of the Spring-River System in Weeki Wachee Area and the Lower Withlacoochee River, West-Central Florida,
W79-02655 4B

SPRINKLER IRRIGATION
Assessing the Spatial Variability of Irrigation Water Applications,
W79-02632 3F

ST. LAWRENCE ESTUARY
Trace Metals in the Waters of a Partially Mixed Estuary,
W79-02687 2K

ST. MARY'S RIVER
Chemical Limnology of the North Channel, 1974,
W79-02921 5A

STABILITY
Fine Structure Instabilities Induced by Double Diffusion in the Shelf/Slope Water Front,
W79-02851 2L

STANDARDS
Mineral Mining and Processing Point Source Category Effluent Guidelines and Standards: Phosphate Rock Mining,
W79-02534 5G

STANDING CROPS
Plant Standing Crop and Productivity Relations in a Scirpus-Equistum Wetland,
W79-02936 2I

STATE GOVERNMENTS
Interim Report of the Governor's Task Force on Water Resources
W79-02700 6D

STATISTICAL METHODS
Methodology Developed for Assessment of Fish and Macroinvertebrate Communities in the New River, Virginia,
W79-02606 5C

A Measure of Response to Perturbation Used to Assess Structural Change in some Polluted and Unpolluted Stream Fish Communities
W79-02996 5B

STEEL
Evaluation of the Corrosion Resistance of Alternate Revetment Wire Fabric Materials in the Lower Mississippi River,
W79-02872 8G

STEEL PLANTS
Characterization and Evaluation of Wastewater Sources, United States Steel Corporation, Irvin Plant, Pittsburgh, Pennsylvania, August 18-28, 1975.
W79-02515 5B

STEELHEAD TROUT
Effects of Reduced Nighttime Flow on Upstream Migration of Adult Chinook Salmon and Steelhead Trout in the Lower Snake River,
W79-02919 8I

STORM RUNOFF
Hydrologic Data for Urban Storm Runoff from Three Localities in the Denver Metropolitan Area, Colorado.
W79-02646 7C

Water Quality in the Sugar Creek Basin, Bloomington and Normal, Illinois
W79-02660 5B

Implementation and Evaluation of the Use of a Transient Flow Model in Assessing the Impact of Urban Stormwater Runoff on the Water Quality of the Tennessee River at Knoxville
W79-02828 5B

STREAM FISHERIES
A Measure of Response to Perturbation Used to Assess Structural Change in some Polluted and Unpolluted Stream Fish Communities
W79-02996 5B

STREAM FLOW
Assessment and Implementation of In-Stream Value Studies for the Northern Great Plains,
W79-02709 4A

STREAM OXYGEN BUDGET
Field Estimates of Aquatic Plant Respiration and its Application of Stream Dissolved Oxygen Budgets,
W79-02816 5C

STREAM POLLUTION
Forest Service Studies of Soil and Nutrient Losses Caused by Roads, Logging, Mechanical Site Preparation, and Prescribed Burning in the Southeast,
W79-02572 5B

Diversity as a Measure of Benthic Macroinvertebrate Community Response to Water Pollution,
W79-02595 5C

STREAMFLOW
Transit Losses and Traveltimes of Reservoir Releases along the Arkansas River from Pueblo Reservoir to John Martin Reservoir, Southeastern Colorado,
W79-02659 4A

STREAMFLOW REGULATION
The Development of Flood-Potential Index Maps for Pennsylvania,
W79-02598 4A

STREAMFLOW SIMULATORS
Application of Computer Waveform Matching to Monitoring of Hydrologic System Parameters,
W79-02836 7C

STREAMS
Water Quality Assessment Model - Oxygen Dynamics Model for Low-Flow Streams,
W79-02579 5B

Impact of Flow Regulation and Power Plant Effluents on the Flow and Temperature Regimes of the Chattahochee River -- Atlanta to Whitesburg, Georgia,
W79-02648 5B

Preliminary Evaluation of the Water-Supply Potential of the Spring-River System in Weeki Wachee Area and the Lower Withlacoochee River, West-Central Florida,
W79-02655 4B

STRUCTURAL ANALYSIS
Engineerin Condition Survey and Structural investigation of Emsworth Locks and Dam, Ohio River,
W79-02706 8F

Condition Survey of Lock and Dam 3, Ohio River,
W79-02711 8F

STRUCTURAL DESIGN
Predicting Performance of Pipe Culverts Buried in Soil,
W79-02869 8D

STRUCTURAL STABILITY
Engineerin Condition Survey and Structural investigation of Emsworth Locks and Dam, Ohio River,
W79-02706 8F

STRUCTURES
An Investigation of Ice Forces on Vertical Structures,
W79-02865 2C

SUBSURFACE DRAINAGE
An Appraisal of the Hydrogeological Processes Involved in Shallow Subsurface Radioactive Waste Management in Canadian Terrain,
W79-02926 5B

SUBSURFACE WATERS
Establishing Liability for Damage Resulting from the use of Underground Percolating Water: South-Southwest Industries v. Friendswood Development Company,
W79-02555 6E

SUCCESSION
Habitat and Successional Changes of the Atlantic Coastal Ridge of Palm Beach County, Florida,
W79-02713 2I

SUFFIELD
An Appraisal of the Hydrogeological Processes Involved in Shallow Subsurface Radioactive Waste Management in Canadian Terrain,
W79-02926 5B

SUGAR BEETS
The Use of the Protococcaceae for Purifying Waste Water (Primeniye Protokokkovykh Vodorosley Dkya Ochiski Stochnykh Vod),
W79-02797 5D

SUGAR CREEK (ILL)
Water Quality in the Sugar Creek Basin, Bloomington and Normal, Illinois.
W79-02660 5B

SULFATES
Dissolution Potential of Surficial Mancos Shale and Alluvium,
W79-02827 5B

A Rapid and Precise Method for Determining Sulfate in Seawater, Estuarine Waters, and Sediment Pore Water,
W79-02846 2K

Chemical Analysis of Mine Drainage Waters,
W79-02918 5A

SULFIDES
The Effect of Organic Carbon on the Concentrations of Iron and Hydrogen Sulfide in Ground Water,
W79-02908 5A

SULFUR-REDUCING BACTERIA
The Effect of Organic Carbon on the Concentrations of Iron and Hydrogen Sulfide in Ground Water,
W79-02908 5A

SUNFISHES
Cadmium and Zinc Content of Fish from an Industrially Contaminated Lake,
W79-02888 5A

SURFACE DRAINAGE
Butts v. City of South Fulton (Construction of Road which Interfered with Natural Drainage and Caused Flooding Constituted Actionable Nuisance).
W79-02558 6E

SURFACE-GROUNDWATER RELATIONSHIPS
Preliminary Evaluation of the Water-Supply Potential of the Spring-River System in Weeki Wachee Area and the Lower Withlacoochee River, West-Central Florida,
W79-02655 4B

SURFACE RUNOFF
Surface Water Flooding in Urban Areas: Rights and Remedies Under the Common Enemy Doctrine,
W79-02552 6E

Bohemian Brethren Presbyterian Church v. Greek Archdiocesan Cathedral of the Holy Trinity (Runoff Damage Resulting from Grading of Adjoining Property).
W79-02566 6E

SURFACE SEALING
Investigation of Natural Sealing Processes in Irrigation Canals and Reservoirs,
W79-02905 4A

SURFACE WATERS
Selected Hydrologic Data, 1931-77, Wasatch Plateau-Book Cliffs Coal-Fields Area, Utah,
W79-02645 7C

Effects of Bottom Sediments on Infilration from the Miami and Tributary Canals to the Biscayne Aquifer, Dade County, Florida,
W79-02653 5B

Water Resources Data for Oklahoma, Water Year 1977--Volume 2. Red River Basin.
W79-02665 7C

Water Resources Data for Arkansas, Water Year 1977.
W79-02666 7C

Water Resources Data for Oklahoma, Water Year 1977--Volume 1. Arkansas River Basin.
W79-02667 7C

Water Resources Data for West Virginia, Water Year 1977.
W79-02668 7C

Surface Water Resources of Northwest Florida,
W79-02727 2E

Isotope Hydrology of Inland Sabkhas in the Bardawil Area, Sinai,
W79-02841 2H

SURVEYING INSTRUMENTS
Development of a High Precision Capability for Monitoring Structural Movements of Locks and Dams,
W79-02708 8A

SURVEYS
Development of a High Precision Capability for Monitoring Structural Movements of Locks and Dams,
W79-02708 8A

Nesting Wading Bird Populations in Southern Florida,
W79-02753 2I

Warm Bottom Water in Lake Michigan,
W79-02843 2H

Glacier Surveys in Alberta - 1975,
W79-02925 2C

SUSPENDED SOLIDS
Silt Sampling Study, Bonneville Spillway Dam, Bonneville, Oregon.
W79-02861 8D

SUSQUEHANNA RIVER
Technique for Collecting Fish with a Block Net in a Pumped Storage Reservoir,
W79-02976 7B

SUSTAINED YIELD
Policy Goals and Values in Historical Perspective, (Colorado River Basin),
W79-02736 6B

SWAMPS
Biological Productivity in Two Georgia River Swamps,
W79-02720 2H

Developmental and Environmental History of the Dismal Swamp,
W79-02751 2H

Influences of Spring Water Levels on Aquatic and Riparian Plant Distribution in Upper Richelieu and Missisquoi Bay Areas,
W79-02950 2H

Fossil Plants and Coal: Patterns of Change in Pennsylvania Coal Swamps of the Illinois Basin,
W79-02955 2H

SYSTEMS ANALYSIS
Environmental Impact Assessment.
W79-02524 6G

TCDD
Fate of 2,3,7,8-Tetrachlorodibenzo-P-Dioxin (TCDD) in the Environment: Summary and Decontamination Recommendations,
W79-02639 5B

TECHNOLOGY TRANSFER
Desalination Technology Transfer Center,
W79-02840 3A

TEMPERATURE
The Effect of Temperature on Treatment Plant Performance and Related Temperature Studies,
W79-02618 5D

Studies of Nonstationary Temperature Regime of Frozen Dams Made of Local Materials on Permafrost Foundations.
W79-02698 8D

Analytical Computation of the Three-Dimensional Steady-State Temperature Condition of a Dam,
W79-02856 8D

Effects of Temperature on Growth Constants of Selenastrum Capricortnutum,
W79-02876 5C

Aerobic Digestion of Wastewater Sludge Under Low Temperature Conditions,
W79-02911 5D

TEMPORAL DISTRIBUTION
Spatial Changes in Waterfowl Habitat,
W79-02742 2H

TENNESSEE
Butts v. City of South Fulton (Construction of Road which Interfered with Natural Drainage and Caused Flooding Constituted Actionable Nuisance).
W79-02558 6E

Implementation and Evaluation of the Use of a Transient Flow Model in Assessing the Impact of Urban Stormwater Runoff on the Water Quality of the Tennessee River at Knoxville,
W79-02828 5B

TENNESSEE RIVER
Environmental Parameters of the Tennessee River in Alabama: II. Physical, Chemical, and Biological Parameters,
W79-02781 5A

TENNESSEE RIVER (TENN)
Implementation and Evaluation of the Use of a Transient Flow Model in Assessing the Impact of Urban Stormwater Runoff on the Water Quality of the Tennessee River at Knoxville,
W79-02828 5B

TERRAIN ANALYSIS
An Appraisal of the Hydrogeological Processes Involved in Shallow Subsurface Radioactive Waste Management in Canadian Terrain,
W79-02926 5B

TEXAS
Subsidence of Land Caused by Withdrawal of Percolating Water is Actionable on the Theories of Negligence and Nuisance in Fact,
W79-02550 6E

Establishing Liability for Damage Resulting from the use of Underground Percolating Water: South-Southwest Industries v. Friendswood Development Company,
W79-02555 6E

In RE Water Rights of the Cibolo Creek Watershed (Landowner's Claim of Equitable Riparian Water Rights Denied).
W79-02567 6E

Weather Modification Activities in Texas, 1974-77.
W79-02699 3B

Hydraulics and Dynamics of New Corpus Christi Pass, Texas: A Case History, 1972-73,
W79-02707 8B

TEXTILES
Upgrading Textile Operations to Reduce Pollution, Volume 1: In-Plant Control of Pollution.
W79-02504 5D

Upgrading Textile Operations to Reduce Pollution Volume 2; Wastewater Treatment Systems.
W79-02505 5D

TFM
Rapid Method for Determining Concentrations of Bayer 73 in Water During Lampricide Treatments,
W79-02891 5A

THEORETICAL ANALYSIS
Design and Evaluation of Laboratory Ecological System Studies,
W79-02625 5C

THERMAL EFFECTS
Supplement to 'Effects of Thermal Discharges on Physico-Chemical Processes and Water Quality' Vistula River, Poland,
W79-02581 5C

THERMAL EXPANSION
Coefficient of Linear Expansion of Massive Concrete at a Negative Temperature,
W79-02692 8F

THERMAL POLLUTION
Supplement to 'Effects of Thermal Discharges on Physico-Chemical Processes and Water Quality' Vistula River, Poland,
W79-02581 5C

Methodology Developed for Assessment of Fish and Macroinvertebrate Communities in the New River, Virginia,
W79-02606 5C

Phytoplankton and Cooling Systems: Temperature Effects Using Different Intake and Discharge Depths,
W79-02980 5C

THERMAL POWER PLANTS
Phytoplankton and Cooling Systems: Temperature Effects Using Different Intake and Discharge Depths,
W79-02980 5C

THERMAL STRATIFICATION
The Effect of Hypolimnion Reservoir Releases on Fish Distribution and Species Diversity,
W79-02670 6G

THERMAL WATER MONITORING
Supplement to 'Effects of Thermal Discharges on Physico-Chemical Processes and Water Quality' Vistula River, Poland,
W79-02581 5C

TIDAL MARSHES
Energy Flux in a Tidal Creek Draining an Irregularly Flooded Juncus Marsh,
W79-02748 2L

Soils of the Inter-Tidal Marshes of Dixie County, Florida,
W79-02757 2G

TIDAL WATERS
Hydraulics and Dynamics of New Corpus Christi Pass, Texas: A Case History, 1972-73,
W79-02707 8B

TILLAGE PRACTICES
Effect of Tillage Systems on Runoff Losses of Nutrients, A Rainfall Simulation Study,
W79-02680 4C

Soil and Water Loss from Conservation Tillage Systems,
W79-02852 3F

TISSUE
The Effects of Three Phthalate Esters on the Larval Development of the Grass Shrimp Palaemonetes Pugio (Holthuis),
W79-02786 5C

TISSUE ANALYSIS
Techniques for Sampling and Analyzing the Marine Macrobenthos,
W79-02627 5A

Chemical and Biological Survey of Liberty Bay, Washington,
W79-02634 5C

Fate of 2,3,7,8-Tetrachlorodibenzo-P-Dioxin (TCDD) in the Environment: Summary and Decontamination Recommendations,

The Effects of Three Phthalate Esters on the Larval Development of the Grass Shrimp Palaemonetes Pugio (Holthuis),
W79-02786 5C

Toxicity of Bog Water to Embryonic and Larval Anuran Amphibians,
W79-02837 5C

Toxicity-, Accumulation-, and Elimination Studies of Alpha-Hexachlorocyclohexane (Alpha-HCH) with Saltwater Organisms of Different Trophic Levels,
W79-02889 5C

Utilisation Du Protozoaire Cilie Colpidium Campylum Pour La Mesure De La Toxicite Et De L'Accumulation Des Micropollutant: Analyse Critique et Applications (Use of the Ciliated Protozoa Colpidium Campylum for the Measurement of Toxicity and Accumulation of Micropollutants: Analysis and Application),
W79-02894 5C

Actions Ecotoxicologiques de Certains Metaux (CU-ZN-PB-CD) Chez Les Poissons Dulcaquicoles De La Riviere Lot (The Ecotoxicological Action of some Metals (CU-ZN-PB-CD) on Freshwater Fish in the Lot River,
W79-02895 5C

Toxicity of Selected Chemicals to the Fairy Shrimp, Streptocephalus Seali, Under Laboratory and Field Conditions,
W79-02971 5C

TOXICITY TESTING

Chronic Toxicity of Chlordane, Trifluralin, and Pentachlorophenol to Sheepshead Minnows (Cyprinodon Variegatus),
W79-02631 5C

TRACE ELEMENTS

Analysis and Characterization of Trace Elements in Shale Oil Products by Instrumental Neutron Activation Analysis,
W79-02822 5A

Chemical Limnology of the North Channel, 1974,
W79-02921 5A

TRACE METALS

A Report on the Concentration, Distribution and Impact of Certain Trace Metals from Sewage Treatment Plans on the Chesapeake Bay,
W79-02511 5B

Trace Metals in the Waters of a Partially Mixed Estuary,
W79-02687 2K

TRACERS

Use of Neutron Activatable Tracers for Simulating Water and Chemical Flow Through Porous Media,
W79-02814 5B

TRAINING

Program Implementation Procedures: Implementation of Two Year Post High School Wastewater Technology Instructional Programs.
W79-02789 5G

Owens-Corning Fiberglass Corporation Wastewater Treatment Facility, Anderson, South Carolina, Technical Support Project March-May 1973.
W79-02796 5D

TRANSIENT FLOW MODELS

Implementation and Evaluation of the Use of a Transient Flow Model in Assessing the Impact of Urban Stormwater Runoff on the Water Quality of the Tennessee River at Knoxville,
W79-02828 5B

TRANSLOCATION

The Accumulation, Translocation and Degradation of Biocides at Land Wastewater Disposal Sites: The Fate of Malathion, Carbaryl, Diazinon, and 2,4-D Butoxyethyl Ester,
W79-02890 5B

TRANSPIRATION

Resistances to Water Transport in Rice Plants,
W79-02986 2I

The Recovery of Leaf Water Potential, Transpiration, and Photosynthesis of Cotton During Irrigation Cycles,
W79-02990 2D

TREATMENT FACILITIES

Owens-Corning Fiberglass Corporation Wastewater Treatment Facility, Anderson, South Carolina, Technical Support Project March-May 1973.
W79-02796 5D

TREATMENT FACILITY

Some Impacts of Safe Drinking Water Standards on Rural Water Systems,
W79-02522 5G

TREES

Developmental and Environmental History of the Dismal Swamp,
W79-02751 2H

TRESCOTT-PINDER MODEL

Preliminary Hydrologic Budget of the Sand-and-Gravel Aquifer Under Unstressed Conditions, with a Section on Water-Quality Monitoring, Pensacola, Florida,
W79-02664 5B

TRIFLURALIN

Chronic Toxicity of Chlordane, Trifluralin, and Pentachlorophenol to Sheepshead Minnows (Cyprinodon Variegatus),
W79-02631 5C

TROPHIC LEVEL

Trophic Interactions.
W79-02610 5C

Biological Availability of Pollutants to Marine Organisms,
W79-02628 5C

Lake Process Models Applied to Reservoir Management,
W79-02716 5A

TUBE WELLS

Development of Cavity Type Tubewells,
W79-03000 8B

TUBEWELLS

Dug-Wells, Dug-Cum-Bore Wells, and Tubewells,

UNIVERSITIES
Water Resources Research Support Program 1978-1979,
W79-02928 6E

UNSTEADY FLOW
Unsteady Streamflow Simulation Using a Linear Implicit Finite-Difference Model,
W79-02644 2E

UPWELLING
A Note on the Circulation Induced by a Shallow-Sea Front,
W79-02688 2L

URBAN DRAINAGE
Surface Water Flooding in Urban Areas: Rights and Remedies Under the Common Enemy Doctrine,
W79-02552 6E

URBAN RUNOFF
Hydrologic Data for Urban Storm Runoff from Three Localities in the Denver Metropolitan Area, Colorado,
W79-02646 7C

Water Quality in the Sugar Creek Basin, Bloomington and Normal, Illinois.
W79-02660 5B

Implementation and Evaluation of the Use of a Transient Flow Model in Assessing the Impact of Urban Stormwater Runoff on the Water Quality of the Tennessee River at Knoxville.
W79-02828 5B

URBAN SOCIOLOGY
Community Development, (Colorado River Basin),
W79-02740 6B

URBANIZATION
Irrigation of Urban Lawns,
W79-02832 3D

USSR
Effect of Subzero Temperature in Concrete on the Nature of Operations of High Concrete Dams,
W79-02690 8F

Concrete Placing Techniques Used During the Construction of the Krasnoiarsk Hydroelectric Power Plant,
W79-02691 8F

Coefficient of Linear Expansion of Massive Concrete at a Negative Temperature,
W79-02692 8F

Specific Features of Construction of Thawed Soil Dams in Severe Climate Conditions,
W79-02693 8D

Thermal Regime of Earth-Rock Dams Constructed in the Far North,
W79-02694 8D

Fundamentals of Constructing Frozen Type Earth Dams in the Arctic,
W79-02695 8D

Constructing Concrete Dams in Regions with Subzero Average Yearly Temperature,
W79-02697 8F

Studies of Nonstationary Temperature Regime of Frozen Dams Made of Local Materials on Permafrost Foundations.
W79-02698 8D

Analytical Computation of the Three-Dimensional Steady-State Temperature Condition of a Dam,
W79-02856 8D

Dam of the Anadyrsk Thermal Electric Power Station,
W79-02862 8D

Designing Concrete Dams for Especially Harsh Climatic Conditions,
W79-02864 8F

An Investigation of Ice Forces on Vertical Structures,
W79-02865 2C

Water Balance of Asia, (In Russian),
W79-02866 2A

Cryopedological Research in the Construction of Dams Under Severe Climatic Conditions,
W79-02867 8D

Dam Design and Construction in the USSR's North and Siberia,
W79-02868 8D

Recommended Practice for the Design and Construction of Earth Dams for Industrial and Potable Water Supply in the Far North and Permafrost Areas.
W79-02871 8D

UTAH
Bauer v. Prestwich (Use of Water on Land Makes it Appurtenant to the Land).
W79-02563 6E

A Chemical Model of Heavy Metals in the Great Salt Lake,
W79-02913 5B

VALUE
Linear Programming Model to Quantify Economic, Environmental and Social Values of a Tidal Marsh,
W79-02723 6B

VANCOUVER LAKE (WASH)
Wetland Habitat Evaluation, Vancouver Lake, Washington,
W79-02952 2H

VEGETATION
Feasibility of the Functional Use of Vegetation to Filter, Dewater and Remove Contaminant from Dredged Materials,
W79-02517 5E

Habitat and Successional Changes of the Atlantic Coastal Ridge of Palm Beach County, Florida,
W79-02713 2I

Notes on the Flora of the Congaree River Floodplain, Richland County, South Carolina,
W79-02756 2I

Plant Biomass and Net Primary Production Along a Flood-Frequency Gradient in the Streamside Forest,
W79-02761 2I

Relations Between Soil Nutrients and Vegetation in Wetheaths. II. Nutrient Uptake by the Major Species in the Field and in Controlled Conditions,
W79-02939 2H

VEGETATION ESTABLISHMENTS
Feasibility of the Functional Use of Vegetation to Filter, Dewater and Remove Contaminant from Dredged Materials,
W79-02517 5E

VERTICAL STRATIFICATION
Seiche Structure and Vertical Mixing Below the Epilimnion in Small Lakes,
W79-02813 5C

VIBRATIONS
Review and Analysis of Blasting and Vibrations at Bankhead Lock,
W79-02701 8H

VIRGIN ISLANDS
Desalination Technology Transfer Center,

W79-02992 3F

UNIVERSITY OF WEST FLOIDA, PENSACOLA. FACULTY OF BIOLOGY.
An Inexpensive and Easily Fabricated Sampler for Colecting Sediment Cores to Measure EH Potentials,
W79-02917 7B

UPPER COLORADO RIVER COMMISSION, SALT LAKE CITY, UT.
Colorado River Development, (Colorado River Basin),
W79-02734 6E

URS CORP., SAN MATEO, CA.
Lake Process Models Applied to Reservoir Management,
W79-02716 5A

UTAH AGRICULTURAL EXPERIMENT STATION, LOGAN.
A Chemical Model of Heavy Metals in the Great Salt Lake,
W79-02913 5B

UTAH CENTER FOR WATER RESOURCES RESEARCH, LOGAN.
Water Conservation Information Dissemination During the 1977 Drought Emergency,
W79-02904 3B

UTAH STATE UNIV., LOGAN.
Recreation, (Colorado River Basin),
W79-02739 6B

Carrying Capacity and Planning, (Colorado River Basin),
W79-02741 6B

UTAH STATE UNIV., LOGAN. DEPT. OF CIVIL AND ENVIRONMENTAL ENGINEERING.
Effects of Temperature on Growth Constants of Selenastrum Capricortnutum,
W79-02876 5C

VERSAR, INC., SPRINGFIELD, VA.
PCBS Water Elimination/Reduction Technology and Associated Costs, Manufacturers of Electrical Capacitors and Transformers,
W79-02800 5D

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. CENTER FOR ENVIRONMENTAL STUDIES.
Culturing and Ecology Studies of the Rotifer Polyarthra Vulgaris,
W79-02624 5C

The Potential and Realized Influences of Temperature on the Distribution of Fishes in the New River, Glen Lyn, Virginia,
W79-02903 5C

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF AGRICULTURAL ECONOMIES.
Economic Incentives for Institutional Change: The Case of the Virginia Wetlands Act,
W79-02721 6E

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF AGRONOMY.
Effect of Irrigation, Lime, and Fertility Treatments on the yield and Chemical Composition of Soybeans,
W79-02991 3F

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF BOTANY.
Methodology Developed for Assessment of Fish and Macroinvertebrate Communities in the New River, Virginia,
W79-02606 5C

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF ENTOMOLOGY.
A Biomonitoring Procedure Utilizing Negative Photoaxis of First Instar Aedes Aegypti Larvae.
W79-02593 5A

VIRGINIA UNIV., CHARLOTTESVILLE. DEPT. OF ENVIRONMENTAL SCIENCES.
Empirical Equations for Some Soil Hydraulic Properties,
W79-02679 2G

The Calibration of a Phytoplankton Growth Model Using Batch Culture Data.
W79-02878 5C

VIRGINIA UNIV., CHARLOTTESVILLE. SCHOOL OF LAW.
Organizing for a National Oceans Program.
W79-02556 6E

VOLCANI INST. OF AGRICULTURAL RESEARCH, BET-DAGAN (ISRAEL).
The Recovery of Leaf Water Potential, Transpiration, and Photosynthesis of Cotton During Irrigation Cycles.
W79-02990 2D

VSESOYUZNYI NAUCHNO-ISSLEDOVATELSKII INST. GIDROTEKHNIKI, LENINGRAD (USSR).
Thermal Regime of Earth-Rock Dams Constructed in the Far North,
W79-02694 8D

WASHINGTON STATE UNIV., PULLMAN. DEPT. OF AGRICULTURAL ECONOMICS.
Social Overhead Capital Costs of Irrigation Development in Washington State,
W79-02719 3F

WASHINGTON STATE UNIV., PULLMAN. DEPT. OF FOREST AND RANGE MANAGEMENT.
Social Impacts from Wildlife Within the Columbia Basin Irrigation District,
W79-02839 6B

WASHINGTON UNIV., ST. LOUIS, MO. DEPT. OF TECHNOLOGY AND HUMAN AFFAIRS.
Factual Inputs for Allocation Decisions Concerning Scarce Water Resources,
W79-02731 6B

WATER AND AIR RESEARCH, INC., GAINESVILLE, FL.
Aquatic Field Surveys at Holston Army Ammunition Plant, Kingsport Tennessee, Final Report,
W79-02630 5C

WATERLOO UNIV. (ONTARIO). DEPT. OF EARTH SCIENCES.
A Three-Dimensional Galerkin Finite Element Model for the Analysis of Contaminant Transport in Variably Saturated Porous Media, User's Guide,
W79-02838 5B

WATERLOOPKUNDIG LAB., DELFT (NETHERLANDS) AND RIJKSWATERSTAAT, RIJSWIJK (NETHERLANDS). DATA PROCESSING DIV.
Hydrodynamic Transport Phenomena in Estuaries and Coastal Waters. Scope of Mathematical models,
W79-02983 2L

WAYNE STATE UNIV., DETROIT, MI. DEPT. OF BIOLOGY.
Use of Commensal Protozoa as Biological Indicators of Water Quality and Pollution,
W79-02643 5C

WEIZMANN INST. OF SCIENCE, REHOVOT (ISRAEL). DEPT. OF RESEARCH.
Isotope Hydrology of Inland Sabkhas in the Bardawil Area, Sinai,
W79-02841 2H

WEST VIRGINIA UNIV., MORGANTOWN. COLL. OF AGRICULTURE AND FORESTRY.
Normal Precipitation in West Virginia,
W79-02984 2B

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MA. JOINT PROGRAM IN BIOLOGICAL OCEANOGRAPHY.
A Rapid and Precise Method for Determining Sulfate in Seawater, Estuarine Waters, and Sediment Pore Water,
W79-02846 2K

WYOMING GAME AND FISH DEPT., CASPER.
Lethality of Electroshock to Two Freshwater Fishes,
W79-02969 5C

WYOMING UNIV., LARAMIE. WATER RESOURCES RESEARCH INST.
Well Field Site Selection Based on Geologic Criteria that Influence Ground Water Circulation in the Vicinity of Laramie, Wyoming,
W79-02912 4B

SELECTED WATER RESOURCES ABSTRACTS

The Library of the
MAY 3 0 1979
University of Illinois
at Urbana Champaign

VOLUME 12, NUMBER 7
APRIL 1, 1979

W79-03001--W79-03500
CODEN:SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS 5285 Port Royal Road, Springfield VA 22161 Annual subscription rates for the North American Continent are SWRA Journal only $75 Journal and Annual Indexes, $100; Indexes only, $50 Other addressees, write for prices

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 12, NUMBER 7
APRIL 1, 1979

W79-03001--W79-03500

e Secretary of the U.S. Department of the Interior has de-
rmined that the publication of the periodical is necessary in the
nsaction of the public business required by law of this Depart-
ment. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

2A. General

A PARAMETRIC MODEL CALIBRATED WITH A PHYSICALLY BASED MODEL FOR RUNOFF PREDICTION FROM UNGAGED STREAMS,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
F. W. Bond.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 690, Price codes: A06 in paper copy, A01 in microfiche. MS Thesis, 1977. 94 p, 30 fig, 3 tab, 17 ref, 2 append. OWRT A-077-ARIZ(1). 14-34-0001-7006.

Descriptors: *Model studies, Forecasting, *Runoff forecasting, Streamflow, *Parametric models, Simulation analysis, Rainfall-runoff relationships, Rainfall intensity, *Watershed modeling.

Recent developments in the numerical solution of the governing partial differential equations for overland and channel flow (represented by sets of intersecting planes) should make possible models which predict runoff from ungaged streams. However, these models (physically based models) are complex and require much computer time. Parametric models exist which have the advantage of being relatively simple, and once calibrated may be used efficiently and inexpensively. This study developed a procedure for calibrating a parametric model against a physically based model utilizing base areas of one acre and one square mile, with the expectation that base areas can be combined to model real watersheds. Simulation experiments with the physically based model showed that, for the one-acre base area, the dominant parameters relate to the slope and friction of the planes, whereas for the square-mile area, the dominant parameters relate to the channel properties. The simple model-fitting parameters were the cell storage ratio, K, for the one-acre area, and K plus a lag factor, L, for the square-mile area. These parameters decreased more or less exponentially with increasing rainfall intensity and with changes in the physical parameters that produced high peaks and fast runoff.

A PRECARIOUS BALANCE UPSET,
V. A. Kovda.
UNESCO Courier, July 1977, p 10-14. 3 fig.

Descriptors: *Desertification, *Comprehensive planning, *Water balance, *Forecasting, Fallowing, Surface runoff, Erosion, Water management(Applied), Water levels, Climatology, Cycles.

In this review of desertification (which this author refers to as aridification), we are shown how the phenomenon traditionally begins as a result of deforestation, increasing surface runoff, a lowering of groundwater tables, and deterioration of grasslands while temperatures and rainfall remain normal. Arid lands can be used productively with cautious and sensible irrigation and grazing management, although today, as in the past, the natural tendency toward desertification and cyclical climatic changes has been greatly aggravated by human error. Characterized by a lack of water, all the arid, semiarid, and dry steppelands of the world are fragile and unstable. Despite the need to maintain an ecological balance in these areas, primitive methods of farming based upon one-crop systems, excessive grazing, and nomadic livestock production beyond the carrying capacity of pastures have been the rule rather than the exception. Unfavorable climatic fluctuations, coupled with the slow pace at which modern knowledge and improved management techniques are disseminated and accepted, have caused specialists to forecast that the trend toward desertification may be expected to continue. (Tickes-Arizona)
W79-03432

2B. Precipitation

DIURNAL VARIATION IN RAINFALL AND CLOUDINESS,
Hawaii Univ., Honolulu. Water Resources Research Center.
T. A. Schroeder, B. J. Kilonsky, and B. N. Meisner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 704, Price codes: A04 in paper copy, A01 in microfiche. Technical Report No 112, July 1977. 67 p, 56 fig, 8 tab, 43 ref. OWRT A-072-HI(1). 14-34-0001-7026.

Descriptors: *Meteorological satellites, *Orographic precipitation, *Rainfall, *Hawaii, Precipitation, Sea breezes, Climatology, Meteorology, *Clouds, Maps, *Rainfall-temporal distribution, *Trade winds.

Maps of diurnal rainfall patterns based on hourly rainfall records are presented for the six major Hawaiian islands. The resulting rainfall distributions demonstrate the complexity of the interaction between trade winds and large islands. Distributions for windward stations on the low islands have early morning maxima common to the tradewind rainfall over open oceans. Mesoscale circulations and moisture extraction by windward mountain barriers modify the oceanic pattern, particularly on the high islands. Patterns on Hawai'i shift from nocturnal maxima on windward coasts to pronounced day time maxima on the leeward coasts. At higher windward elevations on Mauna Loa and Mauna Ke'a, the pattern shows afternoon peaks as contrasted to nocturnal maxima at windward coasts, such as at Hilo. First harmonic R2 approached .90 at windward stations on small islands and in regions of strong mesoscale circulations. For the largest island, Hawai'i, R2 exceeded .60 for all stations examined. Hourly mean cloudiness maps for a two-week period in July 1976 are presented for Hawai'i Island based on SMS-2 geostationary satellite images. Tests verify the subjective analysis procedure, particularly when applied to the visible images. Although rainfall over most of the island was below normal, rainfall frequencies were not, indicating that observed cloudiness was typical of summer conditions. Stations were geographically grouped. Windward coastal stations have small diurnal cloudiness variations but pronounced nocturnal rainfall maxima. Higher elevation windward stations have larger cloudiness variation but smaller rainfall variation, while leeward stations have large and pronounced variations in both rainfall frequency and cloudiness, with maxima occurring in the late afternoon.

HISTORICAL CLIMATOLOGY,
University of East Anglia, Norwich (England). Climatic Research Unit.
M. J. Ingram, D. J. Underhill, and T. M. L. Wigley.
Nature, Vol 276, No 5686, (Climatology Supplement), p 329-334, November 23, 1978. 8 fig, 2 tab, 35 ref.

Descriptors: *Climatology, *History, *Analytical techniques, Data processing, Methdology, Weather data, Climates, Climatic data, Temperature, Precipitation(Atmospheric), Documentation, Information retrieval, Meteorology, Weather, *Historical climatology.

Descriptive documentary evidence is an important source of detailed information on past climates, particularly for the period between the 11th century and the beginning of the era of instrumental meteorology. Historical climatology is concerned with the study and climatic interpretation of this evidence. However, there are many pitfalls in using historical records, associated with the fact that such records were rarely written primarily as descriptions of climate and with the fact that many readily accessible records are of doubtful reliability. A critical look at existing work in the field was taken, with the aim of isolating many problems which need to be recognized and overcome before historical climatology can be considered to rest on a secure methodological and factual footing. (Sims-ISWS)
W79-03068

TREE-RING EVIDENCE OF PAST CLIMATIC VARIABILITY,
Arizona Univ., Tucson. Lab. of Tree-Ring Research.
V. C. LaMarche, Jr.
Nature, Vol 276, No 5686, (Climatology Supplement), p 334-338, November 23, 1978. 6 fig, 40 ref.

Descriptors: *Dendrochronology, *Paleoclimatology, *Climatology, Precipitation(Atmospheric), Rainfall, Temperature, Weather, Trees, Data collections, Data processing, Analytical techniques, Fluctuations, Variability, Climates, Meteorology, Dendroclimatology.

The increasingly visible impact of climatic variability on human affairs lends a sense of urgency to the task of better understanding the workings of the Earth's climatic system. Actual instrumental observations of climate are relatively short, and therefore, it is necessary to turn to other sources for information about past climates to help develop and test the models that may allow the prediction of climatic anomalies such as prolonged droughts or a series of severe winters. Tree-rings are one of the best sources of climatic proxy information. Tree-rings can provide long, accuractely dated, year-by-year records at many points around the globe, and they can bridge the gap between recent instrumental or historical data and the longer but more generalised geological records. Variations in the width of annual rings reflect the influence of

climatic factors that limit the biological processes governing ring formation within a tree. Study of reconstructions of long records of a variety of climatic and related variables, such as temperature, precipitation, stream runoff, and barometric pressure over periods of several hundred to several thousand years strongly suggests that the climate of the past century or so is not representative of the conditions that frequently have prevailed over long periods. Proxy records are a great help in efforts to anticipate or predict future climate, which may be significantly different from the recent climatic past. (Sims-ISWS)
W79-03069

MECHANISMS AND MODELS OF CLIMATIC CHANGE,
Imperial Coll. of Science and Technology, London (England). Dept. of Physics.
G. J. Shutts, and J. S. A. Green.
Nature, Vol 276, No 5686, (Climatology Supplement), p 339-342, November 23, 1978. 4 fig, 15 ref.

Descriptors: *Climatology, *Model studies, *Mathematical models, Methodology, Analytical techniques, Climates, Variability, Solar radiation, Temperature, Dusts, Carbon dioxide, Heat transfer, Oceans, Albedo, Meteorology, *Climatic change.

Many theories about climate change are essentially untestable, but it is still possible to develop a consistent model based on understandable physics--in fact the data cannot be interpreted without one. It is believed that there is some fundamental defect in all present models: it could be something physically improbable, like an unreasonable effect of tiny solar variationes. More likely there is a fundamental lack in an appreciation of how very interactive systems behave. (Sims-ISWS)
W79-03070

NUMERICAL SIMULATION OF CLIMATE AND CLIMATIC CHANGE,
British Meteorological Office, Bracknell (England).
A. Gilchrist.
Nature, Vol 276, No 5686, (Climatology Supplement), p 342-345, November 23, 1978. 20 ref.

Descriptors: *Climatology, *Model studies, *Mathematical models, Equations, Circulation, Air circulation, Albedo, Carbon dioxide, Air pollution effects, Forecasting, Climates, Weather, Temperature, Air temperature, Meteorology, *Climatic change.

Detailed three-dimensional numerical models of the atmosphere, coupled as necessary to models of other parts of the climatic system, provide the most promising approach to understanding the physical basis of climate. Models of this kind can be used to investigate the impact of anthropogenic pollution on climate. At the present time, the main concern is with increasing concentrations of CO2 which might lead to overall warming of the troposphere, but chemical and thermal pollution also may pose a threat. The possible climatic changes would take place slowly and would involve the response of the slowly reacting parts of the climatic system, particularly the oceans. The problem of how to simulate such changes of climate presents many difficulties which are being studied. (Sims-ISWS)

SOLAR-TERRESTRIAL INFLUENCES ON WEATHER AND CLIMATE,
California Univ., Los Angeles. Dept. of Atmospheric Sciences.
G. L. Siscoe.
Nature, Vol 276, No 5686, p 348-352, November 23, 1978. 2 fig, 59 ref.

Descriptors: *Solar radiation, *Weather, *Climatology, Variability, Temperature, Precipitation(Atmospheric), Ozone, Ultraviolet radiation, Correlation analysis, Regression analysis, Cycles, Droughts, Meteorology, Solar variability, Sun-weather relationships, Climatic change, Sunspots, Magnetic effects.

During the past century over 1,000 articles have been published claiming or refuting a correlation between some aspect of solar activity and some feature of terrestrial weather or climate. Nevertheless, the sense of progress that should attend such an outpouring of 'results' has been absent for most of this period. The problem all along has been to separate a suspected sun-weather signal from the characteristically noisy background of both systems. The present decade may be witnessing the first evidence of progress in this field. Three independent investigations have revealed what seem to be well resolved sun-weather signals, although it is still too early to have unreserved confidence in all cases. The three correlations are between terrestrial climate and Maunder Minimum-type solar activity variations, a regional drought cycle and the 22-yr solar magnetic cycle, and winter hemisphere atmospheric circulation and passages by the Earth of solar sector boundaries in the solar wind. The apparent emergence of clear sun-weather signals stimulated numerous searches for underlying physical causal links. (Sims-ISWS)

C. E. Leith.
Nature, Vol 276, No 5686, (Climatology Supplement), p 352-355, November 23, 1978. 2 fig, 10 ref.

Descriptors: *Climatology, *Mathematical models, *Numerical analysis, Forecasting, Weather, Climates, Statistics, Statistical method, Statistical models, Fluctuations, Data processing.

A mathematical framework was presented for the study of the predictability of small changes in the climatic system. From a statistical definition of climate in terms of ensemble averages, a limit to predictability was found which arises from random weather fluctuations. This limit typically referred to as climate noise, is often able to obscure a possible climate signal produced by external forcing. A separation of timescales of climatic response also was presented as a convenient means to distinguish between the fast internal (for example, the atmosphere) and the slow external (for example, the oceans) systems. In this way, it is possible to estimate the climate signal in the internal system that arises from small changes in the slow external system. Finally, a theoretical approach was presented for the inclusion of possible feedback effects in the estimation of a climate signal. Such feedback effects could result from the external climatic system being influenced by a change in the mean properties of the fast internal climatic system. (Sims-ISWS)

PREDICTING TEMPERATURE TREND IN THE NORTHERN HEMISPHERE TO THE YEAR 2000,
British Meteorological Office, Bracknell (England).
M. K. Miles.
Nature, Vol 276, No 5686, (Climatology Supplement), p 356-359, November 23, 1978. 4 fig, 10 ref.

Descriptors: *Climatology, *Temperature, *Air pollution, *Solar radiation, Carbon dioxide, Variability, Fluctuations, Air temperature, Weather, Cycles, Forecasting.

The cooling of the Northern Hemisphere since 1940 has been interpreted variously as the overture to the next Ice Age, the effect of industrial pollution in the atmosphere, or of a decline in the solar output. Are we in a position to judge among these various interpretations and to make a prediction for the next few decades. The link with the next Ice Age may be dismissed as a confusion of timescales; the explanation in terms of atmospheric pollution merits careful examination but seems unlikely to be adequate on its own. Natural fluctuations also must be considered. (Sims-ISWS)

STOCHASTIC MODELS FOR MONTHLY RAINFALL FORECASTING AND SYNTHETIC GENERATION,
Purdue Univ., Lafayette, IN. School of Civil Engineering.
J. W. Delleur, and L. M. Kavvas.
Journal of Applied Meterology. Vol 17, No. 10 October 1978. p. 1528-1536, 3 fig, 4 tab, 9 ref.
OWRT B-036-IND(18).

Descriptors: *Stochastic processes, *Rainfall, *Forecasting, Time series analysis, Precipitation(Atmospheric), Synthetic hydrology, Monthly, *Model studies, Indiana, Illinois, Kentucky, *Rainfall forecasting, *Ohio River Basin.

The Integrated Autoregressive Moving Average (ARIMA) model was applied to the average monthly rainfall time series over 15 basins located in Indiana, Illinois and Kentucky, with areas varying between 240 and 4000 mi approximately. The record length varied from 492 to 6184 months. The first-order, mixed, autoregressive, moving average model emerged as the most suitable one for forecasting and generation of cyclicly standardized monthly rainfall square roots series. The model passed the goodness-of-fit test in all cases studied. The seasonally differenced, multiplicative model applied to monthly rainfall square roots also passed the goodness-of-fit test in all cases. This model has the advantage of requiring fewer parameters than the prrevious one. However, the use of the differenced models is limited to forecasting of monthly rainfall series and cannot be used for the generation of synthetic rainfall time series, as it does not preserve the monthly standard deviations. Seasonal differencing is effective in removing the periodicities but distorts the spectral structure of the original rainfall series, whereas cyclic standardization only introduces a negligible distrotion in the random component while effectively removing the circularly stationary part.

A METEOROLOGICAL APPROACH TO THE IDENTIFICATION OF DROUGHT SENSITIVE PERIODS IN FIELD CROPS,
Orange Free State Univ., Bloemfontein (South Africa).
L. P. de Bruyn, and J. M. de Jager.
Agricultural Meteorology, Vol. 19, No. 1, January 1978, p. 35-40. 3 fig, 8 ref.

Descriptors: *Crop response, *Drought resistence, *Micrometeorology, Planting management, *Moisture stress, Water utilization, *South Africa, Drought tolerance, Soil moisture, Statistical models, Analytical techniques.

A procedure for the determination of drought sensitive periods in field crops is illustrated. Drought sensitivity is derived by means of a statistical model from the correlation of the number of stress days occurring during short periods with growth and yield. Thirty-three different sets of water supply conditions were obtained for the analysis by following different cultivation practices over ten summer seasons. A local long seasoned (145 days) dryland maize was used as the test crop in this attempt to show how a mathematical model using rainfall and evaporation data can be used to assess the degree of sensitivity of yield to drought occur-

ring in short-term periods during the growing season. Customarily drought stress investigations have concentrated on plant and/or soil moisture data. For the present study, however, sensitivity is derived by the magnitude of significant correlation between stress days and growth and yield. Results indicate that number of stress days is a reliable and accurate indication of drought sensitivity. (Tickes-Arizona)

ANTHROPOGENIC IMPACT ON THE ALBEDO OF THE EARTH,
Tel-Aviv Univ. (Israel). Dept. of Geophysics and Planetary Sciences.
J. Otterman.
Climatic Change, Vol. 1, No. 2, p 137-155, 1977. 3 tab, 5 fig, 51 ref.

Descriptors: *Albedo, *Solar radiation, *Grazing, *Remote sensing, *Monitoring, Soil surfaces, Vegetation effects, Irrigation effects, Atmospheric physics.

Activity by man and animal is analyzed here as it affects the surface albedo of the earth. Defined as 'the effective reflectivity integrated over the hemisphere of all possible reflection directions and over all the wavelengths of the solar irradiaton,' surface albedo is variable over different types of terrain. The climatic significance of this study lies in the fact that the albedo of the earth-atmosphere system determines directly how much of the solar irradiation is reflected into space and how much is absorbed by our climatic system. Albedo measurements are complex and can be made either in the laboratory or from the ground, aircraft, or satellite. The anthropogenic impact of overgrazing on change is emphasized here. The unexpected finding from Landsat imagery over Israel is that overgrazing in arid and semiarid regions has a shapr impact of increasing the albedo, where moisture-limited vegetation covers only a fraction of the terrain even when not hindered by man or animal. Additonally, the albedo of clear water bodies is quite low, thus creation of artificial water bodies can result in a sharp decrease of the albedo. Irrigation also results in a very pronounced lowering of the albedo of the soil. Examples from Lake Nasser, the Persian Gulf area, and the Negev-Sinai areas illustrate these observations. But the impact of anthropogenic activities, with the emphasis on overgrazing, prompts this author to recommend continued monitoring, particularly on a seasonal basis in cultivated areas, to determine the effect of albedo on desertification. INTERACTION BETWEEN THE WEST ARABIAN SEA AND THE INDIAN MONSOON,
Institute of Tropical Meteorology, Poona (India).
K. Raghavan, P. V. Puranik, V. R. Mujumdar, P. M. M. Ismail, and D. K. Paul.
Monthly Weather Review, Vol. 106, No. 5, p. 719-724, May 1978. 14 fig, 1 tab, 4 ref.

Descriptors: *Monsoons, *Water temperature, *Sea water, *India, Air circulation, Winds, Vapor pressure, Atmospheric pressure, Meteorology, Snyoptic analysis.

It has been speculated that cold sea surface temperature over the West Arabian Sea leads to a drastic reduction of monsoon rainfall over India and the adjoining region because the cold sea decreases the evaporation rate and increases the surface pressure leading to a reduction in the cross-equatorial flow and moisture flux downstream. The purpose of the present analysis was to test this hypothesis through a short observational study based on the best set of records available for the region. In mid-July 1964, during the International Indian Ocean Expedition, there was a drastic reduction of rainfall in the central parts of India. Surface pressure and temperature, as well as cross-equatorial flow and rainfall were measured in the area. The temperature of the West Arabian Sea was measured and found to be cold over a larger area compared to a wet spell in the same month. Until a high pressure belt approached from India during the drought, there was no organized high pressure zone in the sea as would be expected as a result of the low temperature there. The strengthening and weakening of the Indian monsoon was found, however, to be associated with pressure changes on a synoptic scale, and these pressure changes over India appear to have a controlling influence on the strength of the cross equatorial flow in the West Arabian Sea. N. Tase, and V. Yevjevich.
Hydrlogical Sciences Bulletin, Vol. 23, No. 2, p 203-212, June 1978. 6 fig, 1 tab, 6 ref. NSF ENG 74-17396.

Descriptors: *Droughts, *Regional analysis, *United States, *Great Plains, Size, Shape, Stochastic processes, Gages, Time, Precipitation(Atmospheric), Gaging, Probability, *Drought coverage, *Drought probabilities, Monthly precipitation series, Time-area models, Historical droughts, Grid points.

The stochastic components of monthly precipitation series at gaging stations over the Great Plains of the United States were used to derive time-area models from which new series were generated at a square grid of points. They served as th information for the analysis of area drought coverage by considering the effects of size and shape of a region. Drought probabilities over a region were more affected by size of the region than by its shape, with the shape affecting drought probabilities in the case of small regions. Droughts were studied best by investigating simultaneously their severity (individual time-unit water shortage), total water deficit over time or area, or both time duration and areal coverage. (Roberts-ISWS)

RAINFALL DISTRIBUTION OVER INDIAN SUB-DIVISIONS DURING THE WETTEST AND THE DRIEST MONSOONS OF THE PERIOD 1901-1960,
Institute of Tropical Meteorology, Poona (India).
O. N. Dhar, A. K. Kulkarni, and G. C. Ghose.
Hydrological Sciences Bulletin, Vol. 23, No. 2, p 213-221, June 1978. 3 fig, 5 tab, 3 ref.

Descriptors: *Monsoons, *Rainfall, *Distribution patterns, *Excessive precipitation, *Droughts, Precipitation(Atmospheric), Variability, Seasonal, Precipitation intensity, Spatial distribution, Data processing, Climatology, *India.

An attempt was made to study the rainfall for the subdivisions of India for the wettest and the driest monsoons (i.e., June-September) during the period 1901-1960. All the rainfall stations in each subdivision were taken into consideration to work out the average rainfall of each subdivision for individual months, seasons, and years. The subdivisions of the country that existed on 1 January 1971 were considered. This study showed that during the 60-year period, 1917 was the wettest year and 1918 the driest year. The rainfall distribution in the monsoon periods (i.e., June to September) of the wettest and driest years, 1917 and 1918, respectively, was studied. Possible meteorological causes for the exceptional rainfall in 1917 and the drought in 1918 also were mentioned briefly. (Sims-ISWS)

ARE DESERTS MAN-MADE,
Cairo Univ., Giza (Egypt).
M. El-Kassas.
UNESCO Courier, July 1977, p 4-6. 2 fig.

Descriptors: *Deserts, *Desertification, *Fluctuations, *Rainfall, *Cycles, Arid lands, Erosion, Equilibrium, Land use, Carrying capacity, Seasonal, Variability, Economic aspects, Political aspects.

This author characterizes the world's deserts, which cover approximately one-third of the Earth's land surface, into runoff deserts, rainfall deserts, and rainless deserts. Such categorizaton, he admits, is arbitrary, but certainly rainfall, or the lack of it, is one of the crucial climatic elements shared by all arid and semiarid regions. Principle considerations are the seasonal, variable, short-term, deficiency characteristics of rainfall, all of which play a role in the phenomenon of desertification, defined for the purpose of this analysis as retrogressive ecological changes in vegetation, soil, and water regimes that reduce productivity, lower carrying capacity, or make the land more vulnerable to erosion. Organisms, man, plant, animal, are all in a precarious and dynamic equilibrium in these arid areas with scarce natural resources. Failure to keep within the bounds of this equilibrium can create irreversible desertification. Traditionally, land usage in these regions has followed a cyclic pattern, including shifting cultivation followed by colonization and orchard periods, with the end result always being deterioration of the land. An analysis of these cyclic patterns supports this author's conclusion that desertification is but the end result of ecological, economic, and political pressures. (Tickes-Arizona)

SEDIMENTOLOGY OF MEDIAL MORAINES ON BERENDON GLACIER, BRITISH COLUMBIA, CANADA: IMPLICATIONS FOR DEBRIS TRANSPORT IN A GLACIERIZED BASIN,
University of East Anglia, Norwich (England). School of Environmental Sciences.
N. Eyles, and R. J. Rogerson.
Geological Society of America Bulletin, Vol 89, No 11, p 1688-1693, November 1978. 9 fig, 48 ref.

Descriptors: *Glaciers, *Canada, *Sediments, *Glacial sediments, On-site investigations, Laboratory tests, Glacial drift, Particle size, Rocks, Bedrock, Glaciology, Sedimentology, *Berendon Glacier(Canada).

The character of sediments from medial moraines on Berendon Glacier, British Columbia, reflects periglacial processes rather than direct glacial erosion and transport. Sediments are passively transported as talus by the glacier, and a distinct sedimentology can be contrasted with lodgement tills. Medial moraine sediment is derived from a number of sources and is transported on the glacier surface and at depth near the glacier bed--there is no evidence of either textural evolution with increasing distances of glacial transport or enhanced scour of the glacier bed in the vicinity of medial moraines. Particle-size distribution of both medial moraine debris (supraglacial morainic till) and lodgment tills was found to be independent of source rock. A bimodal grain-size distribution widely reported from the analysis of far-traveled Pleistocene tills from the mid-latitudes, reflecting the crushing characteristics of component minerals in the source rock, is not exhibited by tills from Berendon Glacier, which have well-defined lithological sources. This reflects the short distances of debris transport by the glacier and is considered to be typical of other temporal valley glaciers. (Sims-ISWS)

WILL DESERTS DRINK ICEBERGS,
P. E. Victor.
UNESCO Courier, February 1978, p 17-22. 5 fig.

Descriptors: *Icebergs, *Sea ice, *Melt water, *Future planning(Projected), *Imported water, *Water transfer, Water sources, Planning, Freshwater, Economic feasibility, Project feasibility.

As world demands for fresh water increase, only two methods stand out as viable alternatives for increasing the present supply of freshwater:desalination of sea water and use of polar ice. Although icebergs contain the purest water on earth, it is estimated that the Antarctic icecap loses more than 10,000 billion cubic meters of ice per year in the form of icebergs which eventually melt and disappear. Much of this loss and perhaps more is regained through accumulated snowfall. It is estimated that an average-sized iceberg would provide 80 billion liters of freshwater, even after a 20 percent loss during transportation. Because icebergs from the north pole are of irregular unstable shape and smaller size, it is likely that the larger and more regular shaped icebergs from Antarctica will be the source of the first transported ice. Economically it is estimated that such a project would cost 60 cents per cubic foot of water as compared to the present 80 cents for the same quantity delivered through desalination. The technical feasibility of iceberg transportation is presently under study by an international scientific commission of ten scientists appointed following an international conference in Iowa in 1977. Research into the questions of iceberg drift, structure, internal stress, erosion, and other practical and theoretical problems is underway, and although many answers are needed, icebergs are a promising and exciting source of future freshwater. Paper presented at the 1976 Annual Meeting, American Society of Agricultural Engineers University of Nebraska, Lincoln, June 27-30, 1976. Pa=per No. 76-2085. ASAE St. Joseph, Michigan, 17 p, 7 fig, 2 tab, 13 ref. OWRT A-045-IDA(2), 14-34-0001-6013.

Descriptors: Floods, Rain, *Flood forecasting, *Frozen ground, *Frozen soils, Runoff, Temperature, Classification, Soil temperature, Erosion, Flood damage, *Idaho, Washington, *Discriminant analysis, Freeze-thaw cycles, Palouse Area.

Floods occurring on frozen ground are destructive, both from the point of view of flood severity and erosion hazard. Discriminant analysis was used to classify past runoff events as occurring on frozen or unfrozen ground. For the Greater Palouse area, the average minimum temperature during the freeze period was the single most important variable in classification of events. The method did not appear to work well for a large basin in southern Idaho.

Evaporation from the snowpack during chinooks results in significant moisture loss along the eastern slopes of the Rocky Mountains in Alberta, Canada. From January through March 1976, calculated potential evaporation was as high as 88 mm depth of water above the tree line and 53 mm below tree line. Potential evaporation averaged 1.2 mm/day in 1975, and 2.0 mm/day in 1976. Snowpack evaporation was no greater at the two major gaps in the study area than where no gaps existed. Evaporation was greater above tree line than below tree line, but is was not a function of elevation. For the same 3-month period, there were 24 chinook days in 1975 and 22 in 1976. (Roberts-ISWS)

A HIGH-ACCURACY RECORDING PAN-EVAPORIMETER AND SOME OF ITS POSSIBILITIES,
Institute for Land and Water Management Research, Wageningen (The Netherlands).
G. W. Bloemen.
Journal of Hydrology, Vol. 39, No. 1/2, p 159-173, October 1978. 11 fig, 1 tab, 10 ref.

Descriptors: *Evaporimeters, *Instrumentation, *Evaporation pans, Rainfall, Gravitational water, Plastics, Gaging, Free surfaces, Water loss, Evapotranspiration, *Recording pan-evaporimeter, Plastic dome, Free water surface, Open water evaporation, Shielding, Evaporigraphs.

An instrument was described which was built to record simultaneously pan evaporation and rainfall with a high degree of accuracy. It is in use for routine measurements, but also can be applied to the investigation of some aspects of pan evaporation. In this context, the influence of the depth of the evaporation pan was demonstrated. It was shown that an open pan is unsuitable for gaging evaporation or rainfall on rainy days. An explanation was given of the need of shielding the pan from rainfall with a plastic dome during routine measurements of open-water evaporation. (Roberts-ISWS)

Journal of Hydrology, Vol. 39, No. 1/2, p 113-127, October 1978. 3 fig, 1tab, 15 ref.

Descriptors: *Unit hydrographs, *Model studies, *Systems analysis, Hydrologic systems, Statistics, Statistical models, Stability, Hydrology, Least squares method, Equations, General linear model, Filtered least squares, Constrained least squares, Linear-equality constraints, Linear-inequality constraints.

Prior information was used to tackle the stability problems encountered in estimating the parameters of the general linear model. Constraints were incorporated into the estimation of a unit hydrograph where the observed sample inputs are highly collinear. The effects of the constrained estimation on the stability of the system and on the statistical properties of the estimator were examined. Constraints for volume, smoothness, nonnegativity, and a monotonic recession were included. These were applied separately and in different combinations, and the results were described. (Lee-ISWS)

FLOOD FREQUENCY ANALYSIS BY POWER TRANSFORMATION,
Indian Inst. of Tech., New Delhi. Dept. of Civil Engineering.
S. Chander, S. K. Spolia, and A. Kumar.
Journal of Hydraulics Division, American Society of Civil Engineers, Vol. 104, No. HY11, Proceedings Paper 14179, p. 1495-1504, November 1978. 4 fig, 5 tab, 11 ref.

Descriptors: *Flood frequency, *Flood plains, *Food routing, Floods, *Frequency analysis, Hydrology, Statistical methods, Equations, Foreign countries, Foreign research, *Statistical analysis, Kurtosis, Transformation.

Flood peaks were estimated using the power transformation method. This method was preferred as it does not require a prior knowledge of the frequency distribution of the population. Annual flood peaks for 15 rivers were analyzed, and it was shown that power transformation is more effective than SMEMAX and log transformations in normalizing the skewed flood distribution. The effect of kurtosis also was taken into account in the estimation of flood peaks. Flood peaks of 100-yr and 200-yr recurrence intervals were computed using power transformation method, and the results were compared with several existing methods. Frequency curves of actual data were plotted, and it was shown that, at higher probability of non-exceedance, curves based on power transformation fit closest to the observed data. (Lee-ISWS)

J. T. Limerinos.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 500, Price codes: A03 in paper copy, A01 in microfiche. Water-Resources Investigations 78-66, October 1978. 38 p, 3 fig, 6 tab, 29 ref.

Descriptors: *Water temperature, *Streams, *California, Data collections, Monitoring, Measurement, Evaluation, Statistical methods, Thermographs, Harmonic analysis.

Statistical analysis of water-temperature data from California streams indicates that, for most purposes, long-term operation of thermographs (automatic water-temperature recording instruments) does not provide a more useful record than either short-term operation of such instruments or periodic measurements. Harmonic analyses were made of thermograph records 5 to 14 years in length from 82 stations. More than 80 percent of the annual variation in water temperature is explained by the harmonic function for 77 of the 82 stations. Harmonic coefficients based on 8 years of thermograph record at 12 stations varied only slightly from coefficients computed using two equally split 4-year records. At five stations where both thermograph and periodic (10 to 23 measurements per year) data were collected concurrently, harmonic coefficients for periodic data were defined nearly as well as those for thermograph data. Results of this analysis indicate that, except where detailed surveillance of water temperatures is required or where there is a chance of temporal change, thermograph operations can be reduced substantially without affecting the usefulness of temperature records. (Woodard-USGS)

ANALYSIS OF RUNOFF FROM SMALL DRAINAGE BASINS IN WYOMING,
Geological Survey, Cheyenne, WY. Water Resources Div.
G. S. Craig, Jr., and J. G. Rankl.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $2.20. Water-Supply Paper 2056, 1978. 70 p, 31 fig, 15 tab, 24 ref.

Descriptors: *Rainfall-runoff relationships, Small watershed, *Model studies, *Design criteria, *Flood frequency, Flow characteristics, Wyoming, Analytical techniques, Regression analysis, Synthetic hydrology, Hydrographs, Road design, Culverts, Planning.

A flood-hydrograph study has defined the magnitude and frequency of flood volumes and flood peaks that can be expected from drainage basins smaller than 11 square miles in the plains and valley areas of Wyoming. Rainfall and runoff data, collected for 9 years on a seasonal basis (April through September), were used to calibrate a rainfall-runoff model on each of 22 small basins. Long-term records of runoff volume and peak discharges were synthesized for these 22 basins. Flood volumes and flood peaks of specific recurrence intervals (2, 5, 10, 25, 50, and 100 years) were then related to basin characteristics with a high degree of correlation. Flood volumes were related to drainage area, maximum relief, and basin slope. Flood peaks were related to drainage area, maximum relief, basin slope, and channel slope. An investigation of ponding behind a highway embankment, with available storage capacity and with a culvert to allow outflow, has shown that the single fast-rising peak is most important in culvert design. Consequently, a dimensionless hydrography defines the characteristic shape of flood hydrographs to be expected from small drainage basins in Wyoming. For design purposes, a peak and volume can be estimated from basin characteristics and used with the dimensionless hydrograph to produce a synthetic single-peak hydrograph. Incremental discharges of the hydrograph can be routed along a channel, where a highway fill and culvert are to be placed, to help determine the most economical size of culvert if embankment storage is to be considered. (Woodard-USGS)

BANK-FULL DISCHARGE OF RIVERS,
Geological Survey, Denver, CO. Water Resources Div.
G. P. Williams.
Water Resources Research, Vol 14, No. 6, p 1141-1153, December 1978. 2 fig, 3 tab, 51 ref, append.

Descriptors: *Streamflow, *Bank storage, *Flood plans, *Streamflow forecasting, Analytical techniques, Data collections, Gaging stations, Estimating, Equations, Channel morphology, Evaluation, *Bankfull discharge.

Eleven possible definitions of 'bankfull' have been used by various investigators. The active floodplan is the most meaningful bankfull level to the fluvial geomorphologist, whereas the banks of the valley flat are the most important to engineers. Comparison of 16 ways of determining bankfull discharge suggests that bankfull discharge at gaged sites should be obtained from the station's rating curve, where bankfull gage height is determined for a longitudinal profile of the floodplain along the entire reach. At ungaged sites, bankfull discharge can be estimated from the empirical equation of this study or from the Gauckler-Manning equation. Bankfull discharge does not have a common recurrence frequency among the rivers studied. (Woodard-USGS)

2F. Groundwater

GRAVITY ANALYSIS OF THE SUBSURFACE STRUCTURE OF THE UPPER SANTA CRUZ VALLEY, SANTA CRUZ COUNTY, ARIZONA,
Arizona Univ., Tucson. Dept. of Geosciences.
R. W. Parker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 919, Price codes: A08 in paper copy, A01 in microfiche. M. S. Thesis, 1978. 58 p, 17 fig, 4 tab, 46 ref. OWRT A-078-ARIZ(2). 14-34-0001-7005 and -7006.

Descriptors: *Gravity survey, Groundwater, Southwest US, *Arizona, *Santa Cruz Valley(Ariz), Subsurface structure, Alluvium, Groundwater sources.

A gravity survey was conducted in the Upper Santa Cruz Valley, Santa Cruz County, Arizona. Residual gravity anomalies were interpreted to define the subsurface structure and to estimate the water resource potential. A north-south trending fault system with at least 2000 ft of vertical displacement forms the western half of the basin graben structure. The eastern basin boundary is a combination of northwest- and northeast-trending scarps. These scarps are all extensions of or parallel to inferred surface faulty traces. The valley is divided into three major sections, each having a maximum thickness of 4200 ft of alluvium. Alluvium-covered pediments are present on both sides of the valley. The total volume of ground water available in storage in the Upper Santa Cruz Valley is calculated to be 24.3 million acre feet. This total volume of water is not entirely recoverable, because of permeability factors. The alluvium-covered area east of Nogales is not a basin, but rather is a pediment surface. An alluvium-covered area near Ruby is not sufficiently deep to be a major water resource. A two mile wide gravity low just northwest of Nogales contains about 2200 ft of alluvium and is the dominant subsurface feature of the southern third of the valley.

Descriptors: *Drainage, *Soils, *Sands, *Water tables, *Model studies, Ephemeral streams, Discharge(Water), Equations, Mathematical models, Channels, Geomorphology, Water levels, Cross-sections, Drainage density, Depth, Profiles, Maps, Permeability, Channel morphology, Groundwater, *Channel geometry, *Hydraulic head ratio, Saturated thickness.

In the undulating areas in the eastern part of The Netherlands (elevation 5-30 m above sea level), only the largest drainage channels have a perennial discharge, while the smaller channels have an ephemeral discharge which is considerable in wet periods, but absent in dry periods. The usual drainage formulas cannot be applied satisfactorily in such situations. A considerable improvement can be obtained by taking into account the differences in channel size, the differences in open-water level, and the drain density (length per unit area) of all drains exceeding a certain bottom depth. The intensity of groundwater flow and open-water flow depends on the differences in height between phreatic surface, open-water level, and bottom depth. Although not strictly necessary, a constant ratio has been assumed for these hydraulic head values relative to the channel bottom in order to obtain a simple and still accurate formula for the relation between drain discharge from the area considered and depth of the phreatic surface below ground surface. DRAINAGE OF UNDULATING SANDY SOILS WITH HIGH GROUNDWATER TABLES, II. THE VARIABLE HYDRAULIC HEAD RATIO,
Institute for Land and Water Management Research, Wageningen (Netherlands).
L. F. Ernst.
Journal of Hydrology, Vol. 39, No. 1/2, p 31-50, October 1978. 14 fig, 3 tab, 13 ref.

Descriptors: *Drainage, *Soils, *Sands, *Water table, *Flow, *Model studies, Water levels, Hydrologic properties, Drainage area, Channel flow, Gradients(Streams), Depth, Channel morphology, Roughness coefficient, Equations, Mathematical models, Groundwater, Hydraulic head ratio, Saturated thickness.

In the preceding paper, a new drainage formula was given, the derivation of which was based mainly on an analysis of the question of how much groundwater flow depends on the permeability of the underlying ground and on the often rather complex geometric properties of the channel network in the drainage basin considered. In this paper, due consideration also was given to the open-water flow, requiring the investigation of other hydrologic properties such as the average relations between drainage area, channel gradient, roughness coefficient, and channel size. The hydraulic head ratio between groundwater flow and open-water flow strongly depends on the bottom depth of the drainage channel and on the depth of the phreatic surface. By substitution of an adequate expression for this hydraulic head ratio into the basic drainage formula, the final expressions could be improved, especially regarding the distribution of the groundwater discharge to the large drainage channels. For wet conditions, this is not of maor significance on the relation between total discharge and groundwater depth. (See also W79-03276) (Visocky-ISWS)

DRAINAGE BY PARTIALLY PENETRATING RECHARGE WELLS IN A LEAKY AQUIFER,
India Inst. of Tech., Kharagpur. Dept. of Agricultural Engineering.
P. K. Chowdhury, and B. Anjaneyulu.

Journal of Hydrology, Vol. 39, No. 1/2, p. 51-57, October 1978. 5 fig, 2 ref.

Descriptors: *Drainage, *Model studies, *Recharge wells, Drainage wells, Recharge, Wells, Groundwater, Groundwater recharge, Equations, Laboratory tests, Aquifers, *Partial penetrating recharge wells, Leaky aquifer, Penetration ratio, Recharge rate.

Recharge wells can be considered as a possible solution for the drainage of waterlogged areas which have no gravity outlets. A knowledge of the capacity of the recharge wells is useful in estimating the number of wells needed to provide drainage relief to a particular area. Laboratory experiments were conducted on a sand model simulating a leaky artesian aquifer underlying an unconfined aquifer. The unconfined aquifer in the model was overlain by topsoil which was kept ponded to simulate a waterlogged condition. The recharge characteristics of a well partially penetrating the leaky artesian aquifer were studied under different conditions. Based on experimental data, empirical equations were proposed for predicting the recharge rate. (Lee-ISWS)

Descriptors: *Groundwater movement, *Analytical techniques, *Model studies, *Aquifers, Mathematical models, Analysis, Numerical analysis, Dispersion, On-site investigations, Flow, Tracers, Radial flow, Type curves, Finite difference analysis.

Tracer field measurements on groundwater radial flow yield the mass-transfer parameters economically, when performed on wells already equipped with satellite piezometers. The interpretation of the restitution curve gives rise to some difficulty as there is practically no exact analytical solution to mass transfer radial flow, either diverging (central injection) or converging flow (central pumping and injection of tracer in the satellite piezometer) with continuous or instantaneous injection. This paper presented a simple finite-difference method, free of any numerical dispersion, for the integration of transfer in radial flow equations. It was shown, by calculation of average concentrations on concentric circles, that transversal dispersion has no effect (in the hypothesis of pure hydrodispersive transfer) on the concentration measured in the central well (in the case of central pumping). Programs based on this method allows, with the use of proper dimensionless parameters, the building of type curves for each combination of flow direction and injection mode. It was shown that in each of the four studied cases, there exists an approximate analytical formula which fits the real curves as long as the Peclet number is high enough (over 3). Automatic and manual methods were proposed in order to apply the results to the identification of effective porosity and dispersivity. Several examples of manual identification were given for monolayer aquifer cases, and even for a two-layer case. (Humphreys-ISWS).

A. D. Schneider, and J. N. Luthin.
Transactions of the American Society of Agricultural Engineers, Vol. 21, No. 5, p 920-923, 930, September-October 1978. 5 fig, 10 ref.

Descriptors: *Groundwater, *Recharge, *Model studies, *Mathematical models, Artificial recharge, Infiltration, Percolation, Permeability, Impervious soils, Hydraulic conductivity, Steady flow, Groundwater movement, Hydrology, Groundwater recharge, *Perching, *Perched mounds, Groundwater mounds, Perching conditions, Semipervious layers.

Formation of perched groundwater mounds was analyzed through numerical analysis of coupled saturated-unsaturated soil water flow. The unsteady soil water flow equation was solved by the Alternating Direction Implicit (ADI) numerical technique with iteration to remove the nonlinearity. In the numerical model, hydraulic conductivities, recharge rates, and flow domain geometry were varied to observe the important parameters affecting the formation of perched water table. The rate of formation of perched water tables depended primarily on the recharge rate and the saturated hydraulic conductivity of a semi-pervious, subsurface layer. If the ratio of the recharge rate to this hydraulic conductivity was less than 10, a perching condition did not exist. When the ratio ranged from 10 to 25, the perching condition was weak. When the ratio greater than 25, the perching condition was strong. (Sims-ISWS).

INFILTRATION FROM TRIBUTARY STREAMS IN THE SUSQUEHANNA RIVER BASIN, NEW YORK,
Geological Survey, Albany, NY. Water Resources Div.
A. D. Randall.
Journal of Research of the U S Geological Survey, Vol 6, No 3, p 285-297, May-June 1978. 6 fig, 2 tab, 19 ref.

Descriptors: *Groundwater recharge, *Infiltration rates, *Surface-groundwater relationships, *Natural recharge, *Streambeds, Permeability, Hydrogeology, Seepage, Water loss, Hydraulic conductivity, Streams, New York, *Susquehanna River basin.

As tributary streams in the Susquehanna River basin in New York leave narrow upland valleys and enter larger valleys floored with permeable stratified glacial drift, they lose water by infilration through streambeds. The infiltration rate is generally slow near the point of entering a larger valley, but farther downstream it is much faster and is approximately constant per unit distance along a given stream. A conservative average value of infiltration rate in the downstream reach is 10 liters per second per 100 meters of channel. Infiltration from these streams is little influenced by stream width, depth, or temperature and seems to be controlled by permeability distribution beyond the streambed in the alluvium or underlying glacial drift rather than by permeability at the streambed. Hydraulic conductivity of earth materials near each of the streams studied was calculated by applying models that describe steady-state saturated flow into isotropic materials with various boundary conditions. Hydraulic conductivities of 4 to 41 meters per day were obtained; 13 meters per day is suggested as a conservative average value for silty gravel alluvium in the Susquehanna River basin. THE DEPENDENCE OF THE RESIDUAL GRAVITY ON HYDRAULIC CONSTANTS IN GLACIAL DEPOSITS,
Rhode Island Univ., Kingston. Dept. of Geology
R. K. Frohlich.
Water Resources Bulletin, Vol. 14, No. 4, p. 931-941, August 1978. 8 fig, 2 tab, 8 ref.

Descriptors: *Streams, *Channels, *Residual gravity, Hydraulics, *Glacial, Transmissivity, Groundwater resources, Geophysics, Equations, *Rhode Island, Saturated thickness, Bedrock depth.

Buried glacial stream channels contain large and easily accessible groundwater resources. Gravity surveys have been frequently applied for thier location. A gravity survey in the geohydrologically explored Wood River Valley Area of southern Rhode Island shows extreme lows of -2mgals over channel depths of maximal 300 feet. Three gravity profiles were observed in east-west direction across a north-south striking stream channel. The bedrock depth increases rapidly towards the south from 130 to 300 feet. The gravity lows observed across each profile are not related to the bedrock depth but rather to the saturated thickness of the main aquifer and its hydraulic transmissivity. Well logs indicate that the large change of bedrock depth is solely due to an increase of till of low permeability. The volume of the glacial outwash, which is the major groundwater resource, changes little underneath the three profiles. The gravity lows appear to be directly related to the density contrast between glacial outwash and till. The response to the hydraulically more pertinent units renews the interest in the gravity method as it may have a potential to estimate yields of hydrologically complex aquifers. (Bell-Graf)

TRANSIENT AND STEADY FLOW FROM SUBSURFACE LINE SOURCES AT CONSTANT HYDRAULIC HEAD IN ANISOTROPIC SOIL,
Science and Education Administration, Riverside, CA. Salinity Lab.
C. Dirksen.
Transactions of the American Society of Agricultural Engineers, Vol 21, No 5, p 913-919, September-October 1978. 12 fig, 17 ref.

Descriptors: *Soil water, *Soil water movement, *Subsurface flow, *Subsurface irrigation, Infiltration, Hydraulic conductivity, Wetting, Drying, Unsteady flow, Steady flow, Pressure, Moisture content, Drainage, Isotropy, Soil properties, Soil science, Wetting fronts, Hydraulic head.

Water content and pressure head distributions were measured during transient and steady flows from 4 equally spaced line sources maintained at constant hydraulic head in very fine sand in a large laboratory model. Theory and experiment agreed reasonably well. The major differences were a much reduced upward flow and an increased lateral flow below the sources in the experiments. This, and considerations concerning differences in horizontal versus vertical flow between sources, indicated that the soil column exhibited varying degrees of anisotropy, with the hydraulic conductivity being greater horizontally than vertically. After initial wetting, water contents changed little until the wetting fronts reached the bottom. Then the water began to accumulate from the bottom upward. Differences in infiltration rates between sources were predominantly determined by conditions around the sources and were reflected in rates of advance of the wetting fronts, rather than the water content in the regions of uniform flow farther below the sources. Subsequent drainage of the sand provided data for determining the hydraulic conductivity functions and the soil water characteristics. At the same water content, the hydraulic conductivity during wetting was only about half of that during drying. (Sims-ISWS)

THEORY AND SYSTEM OF AUTOMATIC DETERMINATION OF SOIL MOISTURE CHARACTERISTICS AND UNSATURATED HYDRAULIC CONDUCTIVITIES,
Institute for Land and Water Management Research, Wageningen (Netherlands).
D. Boels, J. B. H. M. Van Gils, G. J. Veerman, and K. E. Wit.
Soil Science, Vol 126, No 4, p 191-199, October 1978. 6 fig, 3 tab, 24 ref.

Descriptors: *Soil moisture, *Hydraulic conductivity, *Unsaturated flow, Model studies, Water pressure, Depth, Equations, Darcys law, Measurement, Instrumentation, Data processing, Theoretical analysis, Mathematical models, Infiltration, Laboratory tests, Soil cores.

The moisture characteristic and the unsaturated hydraulic conductivity were calculated from the measured water pressures at different depths in a soil core and the weights during evaporation at the top of the core. The measured water pressure was assumed to represent the mean pressure in a layer of a certain thickness, and the moisture characteristic was assumed to be described with sufficient accuracy by a polynom. The tangent of the polynom in each pressure interval was solved from a set of equations. Assuming that the hydraulic conductivity-water pressure relationship can be described by an exponential relationship with varying constants in the different pressure ranges, the constants can be solved from measured water pressure at two depths and three sequential moments and from the rate of change in water content below some defined depth in the core during two sequential time periods. Up to 10 cores can be handled at the same time. Measuring at a core can be started and stopped at any time. The water pressure at different depths was measured with one pressure transducer, connected with a scannivalve; the weight was measured with a strain-gage load cell; and the data were recorded on a magnetic cassette tape. The recorded data were processed by a computer and stored on a magnetic disc. If the saturated conductivity is relatively high, a steady-state infiltration method is applied to determine the unsaturated hydraulic conductivity at high water contents. (Visocky-ISWS)

IN SITU HYDRAULIC CONDUCTIVITY OF A FRAGIPAN SOIL IN THE SOUTHERN COASTAL PLAINS,
Georgia Univ., Athens.
K. G. Prasad, and H. F. Perkins.
Soil Science, Vol 126, No 5, p 263-268, November 1978. 3 fig, 2 tab, 21 ref.

Descriptors: *Hydraulic conductivity, *Soil types, *Coastal plains, Land use, Perched water, Permeability, Root development, Soil properties, Porosity, Bulk density, Soil horizons, Equipment, Drainage, *Fragipan, In-situ measurement.

More than 250,000 ha of soils having a fragipan or fragic properties occur in the Southern Coastal Plains Soil Province. These soils have moderate to severe land use restrictions, partially due to perched water, slow permeability, and restricted root growth. The Cowarts soil (Fragic Paleudults; fine-loamy, siliceous, thermic family), which is developed from marine sediments, was selected to determine in situ hydraulic conductivities and related hydrological properties. The moderately well-expressed fragipan has higher bulk density, less pore space, smaller pores, less available water, and lower hydraulic conductivity values than horizons above or below the pan. With an increase in hydraulic head, an increase in hydraulic conductivity was less in the fragipan than in associated horizons. (Visocky-ISWS)

SPATIAL VARIABILITY OF SOIL WATER PROPERTIES IN TROPICAL SOILS OF NIGERIA,
Ibadan Univ. (Nigeria). Dept. of Agronomy.
O. Babalola.
Soil Science, Vol 126, No 5, p 269-279, November 1978. 4 fig, 7 tab, 14 ref.

Descriptors: *Soil water, *Tropical regions, *Soil properties, *Spatial distribution, Nuclear meters, Hydraulic conductivity, Moisture content, Bulk density, Soil types, Infiltration, Frequency curves, Equations, On-site investigations, Drainage, *Nigeria.

The internal drainage technique, which employs a neutron moisture meter and tensiometers, was used to evaluate the spatial variability of soil water properties of a 0.34 and 91.6-ha field. The precision with which the soil hydraulic conductivity K, as a function of moisture content theta, could be obtained for a single soil type in the field also was determined. High variability in soil physical properties, such as percent gravel, sand, silt, and clay, and bulk density, resulted in a high variability in soil water retention characteristics and hydraulic conductivity. The coefficients of variability of these soil properties were only slightly higher for the 91.6-ha farm area than for the 0.34-ha area, consisting of one soil type on a nearly level topography. Although the spatial variability of soil water content was relatively low at any time and any depth after cessation of infiltration, ranging from 2.48 to 12.06%, the hydraulic conductivity values were far more divergent, having coefficients ranging from 47.6 to 146.9%. Steady-state moisture content and hydraulic conductivity were normally and log-normally distributed, respectively. The magnitude of soil water flux at any depth was predicted with some success, using a simple prediction equation that requires a knowledge of saturated hydraulic conductivity and the slope of the K (theta) curve near saturation. DERIVATION OF EQUATIONS FOR VARIABLE RAINFALL INFILTRATION,
Colorado State Univ., Fort Collins. Engineering Research Center.
H. J. Morel-Seytoux.
Water Resources Research, Vol. 14, No. 4, p 561-568, August 1978. 7 fig, 2 tab, 9 ref, 2 append.

Descriptors: *Infiltration, *Rainfall, *Ponding, *Mathematical models, Model studies, Equations, Theoretical analysis, Moisture content, Soil water, Porous media, Soils, Hydrology, Ponding time, Variable rainfall.

Formulas were derived for prediction of ponding time and cumulative infiltration following ponding under a condition of piecewise variable and even intermittent rainfall. The derivations do not assume immediate saturation at the surface or a piston displacement of air by water; they include the viscous flow of air. The results were compared with experimental data of James and Larson for two conditions: constant rainfall and intermittent rainfall. The proposed formulas are simple to use, requiring no complex solution of a partial or even an ordinary differential equation. The numerical calculations presented in the paper were performed with a small pocket calculator. The agreement with experimental data is good. (Sims-ISWS)

MOTTLING IN SOIL PROFILES CONTAINING A COARSE-TEXTURED HORIZON,
Department of Scientific and Industrial Research, Palmerston North (New Zealand). Plant Physiology Div.

B. E. Clothier, J. A. Pollock, and D. R. Scotter.
Soil Science Society of America Journal, Vol. 42, No. 5, p 761-763, September-October 1978. 3 fig, 10 ref.

Descriptors: *Soil texture, *Drainage, *Model studies, Mathematical models, *Soil horizons, *Soil profiles, Soil properties, Hydraulic conductivity, Soil water, Soil water movement, Iron, Manganese, Chemical precipitation, Soil science, *Soil mottling.

Mottling often characteristically occurs in fine-textured soil just above an underlying coarse-textured layer. Interpretation of such mottling as representing a normal drainage impedance is misleading as a perched or groundwater table may never occur in the profile. In this paper, a simple soil water drainage model was discussed that aids interpretation of the pattern of mottling in a soil horizon above a coarse-textured layer. Also, the influence of various soil physical parameters on mottling phenomena was alalyzed, suggesting that the more coarse-textured the underlay the greater the propensity to mottle. The tendency to mottle was shown to be greatest in the soil immediately above the coarse-textured layer. The model was applied to the naturally layered Manawatu fine sandy loam, a Dystric Fluventic Eutrochrept. (Sims-ISWS).

Descriptors: *Soil moisture, *Moisture content, *Laboratory tests, *Microwaves, Heating, Drying, Soils, Soil water, Soil types, Analytical techniques, Soil analysis, Soil science, Microwave ovens.

The advantages of microwave treatment over conventional heating are simplicity of operation and a saving of time. A simplified method for soil moisture determination using ordinary filter paper folded into cups for holding the sample was described. The microwave source was a microwave oven rated to deliver 625 W (high power) at a wavelength of 2450 MHz. A filter paper cup, including another piece of tape to seal the top, was weighted, and about a 10-g sample was placed in it and weighed. The cup containing the soil sample was placed in the center of the floor of the microwave oven, and the cup and contents were treated for 3 min. The filter paper cup then was turned over and treated for an additional 3 min. After the cup was removed from the oven, air was allowed to flow over it for 30 sec in a fume hood or with a fan. The cup and contents then were weighed, and the percent moisture was calculated. Soil moisture determinations also were made by the conventional procedure of drying samples at 110C for 18 h. The use of a microwave oven as the heat source to determine the moisture content of soils was found to be speedy and satisfactory. (Sims-ISWS).

RELATIONSHIP TO EXTRACTABLE SOIL MANGANESE TO SOIL PROPERTIES,
Georgia Univ., Experiment. Dept. of Agronomy.
L. M. Shuman, and O. E. Anderson.
Soil Science Society of America Journal, Vol. 42, No. 4, p 666-667, July-August, 1978. 2 tab, 8 ref.

Descriptors: *Manganese, *Soil chemical properties, Soil physical properties, Ammonium compounds, Organic matter, Cation exchange, Greenhouses, *Soil chemistry.

In a greenhouse experiment eight Southeastern soils were amended to give pH levels of 4.8, 5.8, and 6.8 and were treated with 0, 25, and 50 ppm Mn. After growing wheat (Triticum aestivium L.) for 40 days, the soils were extracted for Mn using six extractants: H20, neutral 1N NH40Ac (with and without 0.2% hydroquinone), 'double acid', diethylenetriaminepentaacetic acid (DTPA) and ethylenediaminedi-o-hydroxyphenyl-acetic acid (EDDHA). Except for the low-Mn soils, greater differences in extractable Mn were observed among soil types and soil pH levels than among Mn rates. Extractable Mn was correlated with soil clay content and total soil Mn. Organic matter content with a narrow range from 1.0 to 2.9%, silt content and cation exchange capacity (CEC) were not correlated with extractable Mn. The extractable Mn decreased as soil pH increased for the H20, NH40Ac alone, and DTPA extractants making them preferable for predicting soil Mn availability since higher pH causes Mn to be less available to the plant. HYDRAULIC CONDUCTIVITY OF UNSATURATED POROUS MEDIA: GENERALIZED MACROSCOPIC APPROACH,
Colorado State Univ., Fort Collins.Engineering Research Center.
Y. Mualem.
Water Resources Research, Vol. 14, No. 2, p 325-334, April, 1978. 2 fig, 5 tab, 41 ref.

Descriptors: *Unsaturated flow, *Hydraulic conductivity, *Porous media, Permeability, Moisture content, Statistical methods.

The macroscopic approach which yields the power function relationship between the relative permeability (K sub r) and the effective saturation (S sub e), K sub r = (S sub e) to the nth power, was generalized to allow n to vary with the soil type. The proposed macroscopic approach was verified by the experimental results of 50 soils. It rendered the power function model of (relative permeability - acutal volumetric water content) a flexibility it lacked before by relating the power n to the energy per unit volume required to drain a saturated soil to the wilting point. The proposed model is shown to be an efficient tool for the prediction of the hydraulic conductivity. (Skogerboe-Colorado State)

POTENTIAL USE OF FINELY DISINTEGRATED IRON PYRITE IN SODIC AND IRON-DEFICIENT SOILS,
Colorado State Univ., Fort Collins. Dept. of Agronomy.
P. L. G. Vlek, and W. L. Lindsay.
Journal of Environmental Quality, Vol. 7, No. 1, p 111-114, January-March, 1978. 3 fig, 3 tab, 15 ref.

Descriptors: *Pyrite, *Oxidation, Sulfur, Fertilizers, *Mine wastes, Soil amendments, *Colorado.

The rate of chemical oxidation of iron pyrite in water was measured as a function of particle size. Reducing the particle size greatly increased the rate of oxidation. For pyrite > 250 microns, the pH of the solution leveled off at 5 after 6 hours while the clay size pyrite dropped to pH 4 within 24 hours. In these studies, pyrite was applied at 1% initially with an additional 1% after 1 month to a slightly sodic, iron-deficient, loamy sand soil from Colorado. The soil/water ratio was 1:2. When clay size pyrite was used, the pH of the soil decreased from 8.3 to 7.8 after 1 mo and to 5.7 after 2 mo. The coarser pyrite decreased the pH only slightly. No significant change in the composition of exchangeable ions occurred during the first month, but the composition had changed sufficiently after 2 mo to flocculate the clay. The DTPA-extractable iron increased from 1.5 to 64 ppm for the finest pyrite treatment during 1 mo, copper doubled, and manganese quadrupled during this period. Finely disintegrated pyrite may be useful for reclaiming slightly sodium-affected soils or for providing slow release available iron. (Skogerboe-Colorado State)

A SOIL MOISTURE BUDGET MODEL ACCOUNTING FOR SHALLOW WATER TABLE INFLUENCES,
Purdue Univ., Lafayette, IN. Dept. of Agronomy.
R. G. Stuff, and D. F. Dale.
Soil Science Society of America Journal, Vol. 42, No. 4, p 637-643, July-August, 1978. 9 fig, 1 tab, 15 ref, 10 equ.

Descriptors: *Soil moisture , *Evapotranspiration, *Capillary water, Water balance, Field capacity, *Moisture deficit, Computer models, *Water table.

Soil moisture balance programs developed on well-drained soils were found to be unsatisfactory for a soil underlain by shallow water tables, a condition typical of about 9 million acres of cropland in Indiana. Capillary rise past a 105-cm root zone boundary was estimated as the difference between estimated evapotranspiration (ET) and chages in soil moisture under corn (Zea mays L.) on a tile-drained Typic Argiaquoll at West Lafayette, Ind. during three growing seasons, 1971-1973. Capillary water was found to supply an average of 27% of the ET in periods with little or no precipitation. Computer model estimates showed caillary water to furnish about 17% of the total ET over a 100-day period from 49 days before silking to 50 days after. The derived relationships with those obtained from literature sources and assumptions regarding runoff and recharge were programmed in a computer model for simulating the daly moisture status and changes in the corn root zone. Model inputs were pan evaporation, precipitation, soil moisture characteristics, corn silking date, and initial soil moisture conditions. The model was found to closely track measurements of both soil moisture and water table depths in four independent seasons: early and late plantings in 1970 and 1974. (Skogerboe-Colorado State)

DETERMINING SOIL GYPSUM CONTENT AND EXPRESSING PROPERTIES OF GYPSIFEROUS SOILS,
National Soil Survey Lab., Lincoln, NE.
R. E. Nelson, L. C. Klameth, and W. D. Nettleton.
Soil Science Society of America Journal, Vol 42, No 4, p 659-661, July-August, 1978. 1 fig, 2 ref, 18 equ.

Descriptors: *Gypsum, Sulfates, Soil water, *Soil chemical properties, Soil tests, *Soil chemistry.

The standard method for measuring the gypsum content of soils is a lengthy one, partly because of the presence of Na and Mg sulfates in most gypsic horizons, and partly because of the difficulty in dissolving all the gypsum in the sample. A more rapid method, sufficiently accurate for taxonomic uses, has been developed and is based on loss of crystal water of gypsum upon heating to 105C. Percent gypsum, calculated on an oven-dry weight basis from loss of crystal water, equals 1.038 x percent gypsum by the standard chemical method + 0.17. The standard error of estimate for the new methods is plus or minus 1.8% gypsum. Equations are given for expressing properties of gypsiferous soils on an oven-dry + crystal water of gypsum weight basis. (Skogerboe-Colorado State)

EFFECT OF ORGANIC COLOR AND TURBIDITY OF SECCHI DISK TRANSPARENCY,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
P. L. Brezonik.
Journal of the Fisheries Reseearch Board of Canada, Vol. 35, No. 11, p 1410-1416, November 1978. 4 fig, 2 tab, 18 ref.

Descriptors: *Secchi disks, *Turbidity, *Color, *Florida, Chlorophyll, Plankton, Lakes, Trophic level, Light penetration, Regression analysis, Data processing, Mathematical models, Limnology, *Organic color, *Transparency.

Secchi disk transparency in lakes is a function not only of the turbidity caused primarily by plankton, but also of the organic color level in the water. Multiple regression analysis of data from 55 Florida lakes yielded a close-fitting equation of the type $1/SD = a(Color) + b(Turbidity) + c$. The statistical relationships between inverse transparency and chlorophyll a and between log transparency and log chlorophyll a exhibited greater scatter. Experiments in which concentrated solutions of humic substances were added to a large plastic 'limno-bag' verified the linear relationship between 1/SD and color content, but yielded a different slope than that obtained by regression analysis. The maximum possible transparency (assuming zero turbidity) was similar for both the experimental and regression relationships at color levels above 50 platinum (Pt) units, but increasingly divergent results were predicted by the two approaches at lower color levels. At a color of 100 Pt units, the maximum Secchi disk transparency is about 2.4-2.8 m. Because of the crudeness of transparency measurements, use of the above regression equation to compute transparencies from measured turbidities appeared to be more reliable than use of the experimentally derived equation. A FIELD STUDY OF THE EFFECT OF WATER DEFICIT ON WATER USE EFFICIENCY,
Kansas Water Resources Research Inst., Manhattan.
E. T. Kanemasu.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 761, Price codes: A04 in paper copy, A01 in microfiche. Contribution No 201, October 1978. 49 p. OWRT A-085-KAN(1). 14-34-0001-7036.

Descriptors: *Water stress, Rainout shelter, Canopy temperature, *Water utilization, *Transpiration, *Photosynthesis, *Sorghum, *Soybeans.

In order to study water deficits in the field, it is necessary to control natural precipitation without significantly modifying the other meteorological parameters (solar radiation, temperature, humidity and wind speed). A large (40' x 40') rainout shelter was constructed which automatically covered the experimental plots during periods of rainfall. Experiments were conducted on well-watered and stressed sorghum and soybeans. On both crops, photosynthesis and transpiration were reduced when the available soil moisture decreases below 35% of the maximum available water. Canopy temperatures of sorghum and soybean under well-water conditions were near 33 and 31C. Leaf temperature increased over air temperature during water stress periods.

FACTORS REGULATING THE DISTRIBUTION AND POPULATION DYNAMICS OF THE AMPHIPOD GAMMARUS PALUSTRIS IN AN INTERTIDAL SALT MARSH COMMUNITY,
Maryland Univ., College Park. Dept. of Zoology.
R. F. Van Dolah.
PhD Dissertation, 1977. 101 p.

Descriptors: *Salt marshes, Aquatic population, *Amphipods, Distribution, *Gammarus palustris, Aquatic plants.

Seasonal changes in the intertidal distribution, abundace, and population dynamics of the epifaunal amphipod Gammarus paustris were studied in salt marshes bordering two estuaring rivers located in the Chesapeake Bay. In both rivers, low amphipod densities occurred during the winter corresponding with a subtidal migration. Migrations did not account for the low numbers observed at other times and an examination of the life cycle of this species as well as an egg-ration analysis of the populations indicated that low densities during the summer or late summer and fall were not due solely to life cycle events. Insufficient tolerance to freezing temperatures was postulated as the reason for the distributional shift to subtidal areas during the winter. Amphipod distribution within the intertidal zone at other times of the year was highly correlated with Spartina density. Birth rate and average brood size declined during the early summer as a result of natural adult female

mortality an a decreased proportion of ovigerous to non-ovigerous females. The average brood size/ovigerous female did not declin significantly throughout the reproductive period indicating that food limitation did not induce the observed summer decline in amphipod abundance. (Steiner-Mass)

FIELD MEASURED AND SIMULATED CORN LEAF WATER POTENTIAL,
Agricultural Research Service, Morris, MN.
D. C. Reicosky, and J. R. Lambert.
Soil Science Society of America Journal, Vol. 42, No. 2, p 221-228, March-April, 1978. 6 fig, 2 tab, 27 ref.

Descriptors: *Sweet corn, Simulation analysis, *Moisture content, *Moisture tension, Microenvironment, Stemflow, Leaves.

The dynamic nature and magnitude of field-measured leaf water potential for sweet corn (Zea mays L.) was compared with that predicted by the model TROIKA. Some plant parameters for corn were estimated from the literature and field observation, whereas the moisture desorption curve and the hydraulic conductivity-water content relationship were determined for the Varina sandy loam. Leaf water potential-relative water content relationships were determined in the greenhouse. Hourly microclimate data were used as input to the model, and the predicted and observed values of leaf water potential were compared for 3 days during the growing season. Generally, the model predicted leaf water potential with reasonable accuracy throughout the day. Water potential gradients in the soil were small as compared with those across the root and across the stomatal opening. (Skogerboe-Colorado State)

UPTAKE OF CADMIUM FROM PHOSPHATE FERTILIZERS BY PEAS, RADISHES, AND LETTUCE,
Corvallis Environmental Research Lab., OR.
J. O. Reuss, H. L. Dooley, and W. Griffis.
Journal of Environmental Quality, Vol. 7, No. 1, p 128-133, January-March 1978. 2 fig. 7 tab, 6 ref.

Descriptors: Heavy metals, *Phosphates, Fertilizers, *Cadmium, *Absorption, *Radishes, *Peas, *Lettuce.

Cadmium uptake from phosphate fertilizers by radish, lettuce, and garden peas was investigated in the greenhouse. Reagent grade mono-calcium phosphate and concentrated superphosphate (CSP) were used as a P source on a coarse-textured acid soil. The effect of mono-calcium phosphate compared with that of CSP on radish, lettuce and peas was nonsignificant. On a medium-textured calcareous soil the use of this CSP increased the Cd content of radish tops by about 80% and that of lettuce by 50%. The effect on radish roots from calcareous soil was nonsiginficant. Pea seeds and foliage on this soil were below our Cd detection limit. Uptake on both soils was a linear function of the Cd content of the fertilizer. In the acid soil, spot placement of fertilizer in comparison to mixing it with the soil resulted essentially the same Cd uptake from CSP fertilizer. Spot placement of Di-ammonium phosphate (DAP) almost completely eliminated Cd uptake from the fertilizer. In the calcareous soil spot placement increased Cd uptake from the CSP fertilizer but slightly depressed uptake from DAP. (Skogerboe-Colorado State)

POTASSIUM UPTAKE BY ONION ROOTS CHARACTERIZED BY POTASSIUM/RUBIDIUM RATIO,
Purdue Univ., Lafayette, IN. Dept. of Agronomy.
V. C. Baligar, and S. A. Barber.
Soil Science Society of America Journal, Vol. 42, No. 4, p 618-622, July-August, 1978. 8 tab, 15 ref, 3 equ.

Descriptors: Cations, *Cation exchange, *Potassium, *Onions, *Sweet corn, Selectivity, Diffusivity, *Root systems.

A common belief is that plant roots absorb cations from the solution phase of the soil. Experiments with corn (Zea mays L.) using K./Rb ratio to evaluate the source of K and Rb absorbed indicated the plant roots absorbed these ions in the ratio of exchangeable K and Rb. The objective of this research was to study the source of K and Rb absorbed from soil by onion (Allium cepa) roots since they do not have root hairs and this may influence the uptake mechanism. Onions absorbed K/Rb with a ratio which was intermediate between the ratio of exchangeable K and Rb and the ratio of these cations in solution. In comparison with corn, onions absorbed K at one-third the rate, but absorbed water three times faster so that mass flow contributed a greater proportion of K absorbed by onions than that by corn. This, rather than differences in root hairs may be the reason for the observed differences in K uptake between corn and onions. (Skogerboe-Colorado State)

Descriptors: *Loess, *Sediment distribution, *Sierozems, Soil types, Silts, Wind erosion, Water erosion, *Glacial sediments, Carbonates, Clay minerals, Silicates, Sedimentary petrology, Weathering, Geomorphology, Geophysics.

Loess deposits of the world are divided by nature and distribution into warm-desert loess and cold-glacial loess. Although glacial derived loess is well known by composition and origin, understanding of desert loess has remained somewhat speculative. The purpose of this analysis is to solve some of these problems associated with the nature and formation of true desert loess deposits. Separate analysis of desert loess in China, the Mediterranean, the Middle East, and central Asia reveals that although transported from adjacent deserts, the loess particles themselves had their origins in glacial grinding and cold weather processes in adjacent mountains. Accordingly, deserts not close to such mountainous areas, such as the Sahara and Australian deserts, are lacking in loess deposits. While some researchers have then proposed the glacial and cold weather origin of all loess, it is apparent from recent studies that the weathering of igneous rock is the origin of some desert loess. Additionally, a loess is found in the Persian-Arabian Gulf area which can be distinguished from the normal loess by its fundamental coarse silt composition of carbonate, as opposed to the post depositional carbonate accumulation of the more commonly found loess. It is pointed out, however, that despite these recent studies, the great majority of the world's loess deposits are derived from cold weather and glacial erosion. (Tickes-Arizona)

2K. Chemical Processes

HYDROLOGIC AND CHEMICAL ANALYSES OF THE OLD TOWN AND HAMPDEN, MAINE WELL FIELDS WITH REGARD TO THE HIGH IRON AND MANGANESE CONCENTRATION PROBLEM,
Maine Univ. at Orono. Dept. of Civil Engineering.
C. N. Blanchard, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 741, Price codes: A07 in paper copy, A01 in microfiche. MS Thesis, August 1978. 144 p, 18 fig, 13 tab, 35 ref, 4 append. OWRT A-036-ME(1).

Descriptors: Aquifers, *Iron, *Manganese, Pumping, Recharge, *Water chemistry, *Water wells, Groundwater, *Maine, Pollutant identification, Glaciated terrains.

An investigation of the well fields belonging to the water districts of Old Town and Hampden, Maine was undertaken to understand the mechanisms that cause high concentrations of dissolved Fe and Mn in water pumped from glaciated terrains. Parameters measured in water samples from the well fields were temperature, pH, Eh, alkalinity, O2, CO2, HCO3, sigma Fe, sigma Mn, Ca, Na, Mg, K,

Cl, SO4, and H4SiO4 concentrations. Chemical data indicated that the Old Town and Hampden aquifers (eskers) have considerable recharge from the Stillwater River and the Souadabscook Stream, respectively. Water pumped from production wells was a mixture of 'young' (contains dissolved O2) and 'old' (O2 depleted, generally deeper, and having been in contact with aquifer material and bedrock for a longer period of time) water. The proportion of young to old water pumped appeared to determine the concentrations of dissolved Fe and Mn. This ratio was influenced by pumping rate, well depth and screen length, location and type of recharge (river and/or precipitation), and the aquifer material.

Descriptors: *Atmosphere, *Chemistry, *Chemical properties, Air pollution, Air pollution effects, Chemical reactions, Ozone, Oxygen, Oxides, Hydrogen compounds, Chemicals, Ultraviolet radiation, Carbon dioxide, Weather, Meteorology, Tropospheric chemistry, Stratospheric chemistry, Atmospheric chemistry, Carbon monoxide.

The chemistry of the atmosphere was a largely neglected topic until the last decade, during which concern about pollution has produced a flurry of activity. The processes which may deplete the relatively small amount of ozone in the stratosphere which protects us from harmful UV light have much in common with those in the Los Angeles-type smog which generate ozone and other oxidants. Such systems involve chain reactions in which free radicals such as HO, HO2, and ClO can carry out a chemical conversion process (ozone to oxygen) many times before they are destroyed. Recent research showed that nitrogen oxides from the exhausts of supersonic aircraft or derived from increased use of nitrogenous fertilisers will have little effect on stratospheric ozone, but the potential effects of chlorine compounds, such as aerosol propellants, require careful examination. In contrast, the oxidation of carbon monoxide is now thought to be a major source of ozone in the lower atmosphere. (Sims-ISWS)

WARM SPRINGS, SOUTH ISLAND, NEW ZEALAND, AND THEIR POTENTIALS TO YIELD LAUMONTITE,
Geological Survey, Menlo Park, CA. Water Resources Div.; and Department of Scientific and Industrial Research, Petone (New Zealand). Chemistry Div.
I. Barnes, C. J. Downes, and J. R. Hulston.
American Journal of Science, Vol. 278, p. 1412-1427, December 1978. 2 fig, 5 tab.

Descriptors: *Thermal springs, *Chemical reactions, *Geochemistry, *Zeolites, *Carbon dioxide, Meteoric water, Ionization, Calcite, Water sampling, Analytical techniques, Chemical analysis, Geology, Metamorphic rocks, *New Zealand, Laumontite.

Warm springs (40 to 65C) of South Island, New Zealand, are all supersaturated with laumontite and with few exceptions are either in equilibrium with or are unsaturated with calcite and albite. Two gels with essential cation-oxygen-silicon ionic link were found as reaction products. The waters are meteoric in origin. From isotopic compositions, dissolved CO2 species are in part from oxidation of organic material and in part from the solution of calcite. The CO2 partial pressure range from an exceptionally low value of 0.0000053 atm. to an exceptionally high value of 0.87 atm. The CO2 partial pressures are dependent variables and do not control the chemical reactions. Analcime should not be regarded necessarily as a lower grade metamorphic facies indicator nor should prehnite necessarily be regarded as a higher grade metamorphic product. Rather, they may be products of different chemical rather than physical conditions. (Woodard-USGS)

MICROBIAL ASPECTS OF THE VOLATILE LOSS OF APPLIED MERCURY (II) FROM SOILS,
Oregon State Univ., Corvallis. Dept. of Soil Science; and Oregon State Univ., Corvallis. Dept. of Agriculture Chemistry.
E. R. Landa.
Journal of Environmental Quality, Vol. 7, No. 1, p. 84-86, January-March, 1978. 1 fig, 1 tab, 21 ref.

Descriptors: Autoclaves, *Mercury, *Volatility, *Microbial degradation, Soil amendments, *Montana.

Five surface soils from southeastern Montana were studied to determine the effects of autoclaving and glucose additions on the volatile loss of applied divalent inorganic mercury. Soils were amended to 1 ppm Hg as 203 Hg - Hg(NO3)2, maintained at room temperature near the 1/3-bar moisture content, and Hg content monitored for 7 weeks. Mercury losses from soils receiving neither autoclaving or glucose additions ranged from 5 to 30%. In general, autoclaving reduced the total quantity of Hg lost, while glucose additions increased the initial loss rate of applied Hg. (Skogerboe-Colorado State)

PHOSPHATE ADSORPTION-DESORPTION CHARACTERISTICS OF SOILS AND BOTTOM SEDIMENTS IN THE MAUMEE RIVER BASIN OF OHIO,
Texas A and M Univ., College Station, Dept. of Agronomy.
D. L. McCallister, and T. J. Logan.
Journal of Environmental Quality, Vol. 7, No. 1, p 87-92, January-March, 1978. 2 fig, 6 tab, 27 ref.

Descriptors: *Adsorption, Eutrophication, Pollutants, *Phosphates, Runoff, Isotherms, *Desorption, Soils, Bottom sediments, *Ohio, *Maumee River basin(Ohio).

Langmuir adsorption isotherms showed that Maumee River Basin sediments had adsorption capacities 10 to 20 times greater than Basin soils. Although the soil clay fractions had adsorption capacities higher than the whole soil, they were considerably less than those of the sediments and the difference is attributed to the higher content of amorphous or low-range order iron and aluminum components in the bottom sediments. Equilibrium phosphorus concentration (EPC) and phosphorus desorbed was similar for soil and sediments as well as total P, indicating that although the bottom sediments have a high capacity to adsorb P, this capacity has not been realized. Correlations between adsorption-desorption parameters and soil/sediment properties are presented. Bray Pl 'available' P was highly correlated with EPC and P desorbed in the soils but to a lesser extent in the bottom sediments. CDB and oxalate extractable-P was highly correlated with P adsorption capacity in the bottom sediments but not in the soils. (Skogerboe-Colorado State)

THE MECHANISM OF SULFATE ADSORPTION ON IRON OXIDES,

Griffth Univ., Nathan (Australia). School of Science.
R. L. Parfitt, and R. St. C. Smart.
Soil Science Society of America Journal, Vol. 42, No. 1, p 48-50, January-February, 1978. 5 fig, 2 tab, 17 ref.

Descriptors: *Sulfates, *Adsorption, *Iron oxides, Isotherms, Spectroscopy, Structural models, Soil chemistry.

Adsorption isotherms were determined for sulfate adsorption on iron oxides under acid conditions. The product of the surface reaction between the iron oxides and sulfate ions was examined by infrared spectroscopy which showed four bands in the Nu S-0 stretching region. Thus a structural model could be obtained for the reaction. Two surface hydroxyl groups (or OH2(+) ions) are replaced by one sulfate ion, and two oxygen atoms of the sulfate ion are coordinated each to a different Fe(3+) ion, resulting in the binuclear bridging surface complex Fe-0-S(02)-0-Fe. The complex is formed on the surfaces of goethite (alpha-FeOOH), akaganeite (beta-FeOOH), lepidocrocite (gamma-FeOOH), hematite (alpha-Fe203) and amorphous ferric hydroxide. (Skogerboe-Colorado State)

THE ACETYLENE INHIBITION METHOD FOR SHORT-TERM MEASUREMENT OF SOIL DENITRIFICATION AND ITS EVALUATION USING NITROGEN-13,
Michigan State Univ., East Lansing. Dept. of Crop and Soil Sciences.
M. S. Smith, M. K. Firestone, and J. M. Tiedje.
Soil Science Society of America Journal, Vol. 42, No. 4, p 611-615, July-August, 1978. 1 fig, 6 tab, 11 ref.

Descriptors: *Denitrification, Inhibitors, *Nitrogen-13, Reduction(Chemical), Anaerobic conditions, Aerobic treatment, Soil treatment.

Acetylene was found to effectively inhibit the reduction of N2O by anaerobic soils. With concentrations of C2H2 above 0.1 atm, added NO3(-) was quantitatively converted to N2O and added N2O was reduced at an insignificant rate. Experiments with 13N demonstrated that at low soil nitrate concentrations at least 0.1 atm C2H2 was required for effective inhibition. Denitrification rates determined by 13N and by C2H2 inhibition methods correlated well, as did determination of N2O/(N2 + N2O). The methods also revealed that an acceleration in denitrification rate occurred within a few hours after soil was exposed to anaerobic conditions. The acetylene method was generally used to measure denitrification rates in soils incubated as anaerobic slurries, but was also used to determine rates for field moist aggregates incubated anaerobically and aerobically. When assayed as anaerobic slurries, initial denitrification rates ranged from 0.1 to 0.7 m moles N gas/soil/min for the mineral soils examined. The denitrification rate in aerobic aggregrates was approximately 1,000 times less, showing the strong inhibitory effect of O2 on the indigenous denitrifying enzymes. (Skogerboe-Colorado State)

HYDROLOGY OF SMALL OCEANIC ISLANDS - INFLUENCE OF ATMOSPHERIC PRESSURE ON THE WATER TABLE,
Washington State Univ., Pullman. Dept. of Geology.
H. L. Vacher.
Ground Water, Vol 16, No 6, p 417-423, November-December 1978. 8 fig, 12 ref.

Descriptors: *Islands, *Atmospheric pressure, *Water table, *Model studies, Hydrology, Recharge, Sea level, Ocean waves, Rainfall, Effects, *Oceanic islands, *Sea-level fluctuations, Permeable oceanic island, Ocean fronts, Astronomical tides, Inverted barometer effect, Pressure-related fluctuations.

There is a spectrum of sea level fluctuations that affects the water table of small, permeable islands. At the high-frequency end of the spectrum are the semi-diurnal and diurnal components of the astronomical tides. Also affecting sea level elevation are atmospheric pressure and the temperature and salinity (hence density) of the ocean column. Changes in atmospheric pressure cause sea level changes on the order of up to about 30 cm by what oceanographers call the 'inverted barometer effect'. As a result, pressure changes, like tides, generate waves that migrate across the water table. Amplitudes of the resultant pressure-related water table fluctuations diminish inland. However, owing to the relatively long period of the pressure-related fluctuations, their inland attenuation is far less than that of the hydraulically analogous tides. In fact, in Bermuda for example, the pressure-related water table fluctuations completely dominate water table statistics that reflect day-to-day changes in elevation. Because a drop in pressure and corresponding rise in the water table accompany passage of a storm front, which also bring a rainfall, there commonly is a coincidental, and very misleading, correlation between rainfalls and water table rises. In island and coastal settings, non-tidal sea level changes and their effect on the water table must be considered if recharge is to be evaluated correctly from water table data. (Roberts-ISWS)

TEMPORAL VARIATIONS AND PROBABLE ORIGINS OF HYDROCARBONS IN THE WATER COLUMN OF BEDFORD BASIN, NOVA SCOTIA,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Marine Ecology Lab.
D. C. Gordon, P. D. Keizer, and J. Dale.
Estuarine and Coastal Marine Science, Vol 7, No 3, p 243-256, September 1978. 8 fig, 4 tab, 28 ref.

Hydrocarbons in Bedford Basin seawater were analyzed on 33 dates between January 1975 and April 1976 by fluorescence spectroscopy and gas chromatography. Crude oil equivalent concentrations averaged 2.5 and 1.8 microgram/1 at 2 and 50 m, respectively, while total n-alkanes averaged 200 and 180 ng/l at the same depths. Crude oil equivalent concentrations were slightly higher than generally found in oceanic regions, while total n-alkane concentrations were comparable. Hydrocarbon concentrations tended to be highest in the winter and lowest in the summer. Biosynthesis does not appear to be an important source of hydrocarbons since the concentration of only one hydrocarbon (retention index of 2052 and suspected to be a polyunsaturated olefin reported to be common in marine phytoplankton) increased during the spring phytoplankton bloom. The majority of hydrocarbons appear to be of anthropogenic origin, and the increased use of fuel oils in the urban area surrounding Bedford Basin during the colder months can explain the higher winter-time concentrations. If biosynthesis is not an important hydrocarbon source in Bedford Basin, it can be argued that it is also unimportant in the ocean as a whole. (Sims-ISWS)

Large-scale sand ridges, 10 m or more in height and 2-4 km apart, have long been accepted as characteristic of shelves experiencing strong tidal flow. However, they also occur on inner continental shelves whose strongest flows are wind-induced. The Middle Atlantic Bight of North America is the best known example, but inner shelf ridge topographies occur extensively on other Atlantic shelves. This paper discussed similarities and differences among the inner shelf ridges of North America, South America, and Europe as a necessary step prior to the framing and testing of hypotheses concerning the hydrodynamics of ridge formation. Inner shelf ridges characteristically are aligned obliquely to the shoreline, with acute angles opening into the prevailing flow direction. Downcurrent slopes tend to be steeper and finer grained. The ridges tend to migrate downcoast and offshore, extending their crestlines so as to maintain contact with the shoreface. Where ridges are nearly shore-parallel (current parallel), the movement is expressed as downcurrent growth of ridges and downcurrent extension of swales between

lges. Ridge behavior, and especially ridge migra-
n rates, are necessary information for marine
vironmental management, since ridges are most
tive in the nearshore zone where the shelf floor
used for sewage outfalls, deepwater ports, nucle-
reactor sites, and other structures requiring a
easure of sea floor stability. (Sims-ISWS)

rculation, Oceanography, *Cook Inlet(AK).

urrent, salinity, and temperature data obtained
om lower Cook Inlet during May-September
73 have been analyzed. These data define a
gional mean circulation whose main features are:
) a concentrated southward flow along the west-
n shore of lower Cook Inlet of water from upper
ook Inlet which has been diluted by river input,
) an intense westerly flow across the lower inlet
hich originates from Kennedy Entrance, exits via
elikof Strait, and is bathymetrically steered in a
yclonic sense during its transit across the inlet,
d (3) a slow northward drift in eastern lower
ook Inlet. The southward flow is an estuarine
ode due to freshwater input to upper Cook Inlet.
he westerly flow is driven by the westward flow-
g Alaska Current. The weak northward drift
places water which has been entrained into the
uth flowing current. Large tidal and wind-in-
ced currents are superposed on this mean flow
d contribute to complex temperature and salinity
stributions. The circulation scheme as redefined
ere allows for vertical motions and has important
nsequences in relation to high regional biological
oductivity and fates of contaminants. (Sims-

t follows from measurements that advection is the
ominant mode of transport in the Marco River.
ypical values for the tidally averaged salt and
ater flux were respectively, 400 kg/s and 20 cu
n/s. An analysis of the dynamics of the flow
howed that the longitudinal flux of water is asso-
ciated with the tidal stress, the tidally averaged bottom stress, the spatial variation of the mean water level, and the cross-sectionally averaged salinity. An approximate analytic expression was derived to illustrate the independent effects of the differences in tidal amplitude, phase, mean water level, and density at the open boundaries on the net flux of water. Using a finite difference technique, the magnitude of the tidally averaged water flux and its components associated with the Eulerian mean velocity and Stokes Drift velocity were computed for two schematizations of the Marco River. Computed and measured quantities were in fair agreement. (Sims-ISWS)

Descriptors: Estuaries, Friction, *Manning's equation, Roughness, Estimation, Reynolds number, Hydraulic models, *Delaware River estuary, Model studies, Simulation analysis.

A finite difference version of the Levenberg-Marquardt method for nonlinear least squares prolems has been extended to include inverse problems in distributed estuarial hydraulic systems. The objective in solving the inverse problems was to establish a numerical simulation procedure for estimating best-distributed Manning's roughness coefficients from sets of observed tide heights. As an illustration, spatially varying Manning's roughness coefficients for the Upper Delaware River Estuary system were determined for several representative sets of tide height data for the period October 1973 to June 1974. The roughness coefficients were modeled as polynomial functions of distance. Manning's n was thus found generally to vary inversely with distance from the head of tide at Trenton to Wilmington. The spatially distributed tidal-averaged Reynolds number Re was used to correlate Manning's n and Darcy-Weisbach's f. The resultant n-Re relationships displayed three distinct hydrodynamic flow regimes characterized as having turbulence. Both n and f were found to be independent of Re for Re $<$ 1.52 x 106 but inversely related to Re for Re$>$ 1.2 xx 106. Among the numerical techniques used to simulate tidal hydraulic transients it was found that a 'hopscotch' finite difference method yielded the best compromise between computational economy and overall accuracy.

Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol. 104, No. WW4, Proceedings Paper 14184, p 375-390, November 1978. 17 fig, 2 tab, 15 ref.

Descriptors: *Louisiana, *Beach erosion, *Beaches, *Model studies, Coastal engineering, Hydraulic models, Littoral drift, Sediment transport, Shore protection, *Jetties, Tidal flow.

Channel enlargement and modifications to the jetties at Belle Pass, the mouth of Bayou Lafourche on the Gulf coast of Louisiana, had become necessary due to increased marine traffic by offshore oil and mining production and the fishing industry, along with the proposed development of nearby Port Fourchon. Permission for construction, required by the Corps of Engineers, was granted after map and aerial photo studies, field observations, and hydraulic model experiments showed that beach erosion, and expecially littoral bypassing, would be affected insignificantly by extension to the existing single jetty and construction of a new twin jetty. The average annual recession rate of the coastline in the Belle Pass area between 1885 and 1932 was 79 ft/yr (24m/yr). After construction of the first jetties in 1940, this rate gradually decreased to 25 ft/yr (8 m/yr) by 1974. Most littoral material bypasses the jetties due to inefficient orientation to the present shore line. Field tracking of subsurface floats provided data to calibrate a small, distorted-scale model. M. D. Winner, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 499. Price codes: A03 in paper copy, A01 in microfiche. Water-Resources Investigations 78-52, June 1978. 49 p, 26 fig, 2 tab, 6 ref.

Descriptors: *Groundwater resources, Hydrology, *Aquifer characteristics, *Saline water intrusion, *National seashores, *North Carolina, Water quality, Water yield, Saline water-freshwater interfaces, *Cape Lookout National Seashore(NC).

Fresh groundwater in the Cape Lookout National Seashore in North Carolina occurs in the unconfined aquifer, an upper confined aquifer, and a lower limestome aquifer. The unconfined aquifer beneath dunes on the barrier islands is estimated to yield as much as 30 gallons per minute of freshwater to a horizontal well, but this aquifer is subject to periodic overwash by the ocean, thus temporarily contaminating the aquifer with saltwater. The upper confined aquifer is about 90 to 150 feet deep, but is known to contain freshwater only in the Drum Inlet area. The potential yield of this aquifer where it is fresh is unknown because of the possibility of saltwater encroachment. The lower limestone aquifer (150 to 550 feet deep) contains freshwater southeast of Drum Inlet; potential yields is estimated to be as great as 500 gallons per minute per well. The estimated yields from all aquifers depend on the position of the saltwater interface at any given site. Maps of the Seashore show areas where freshwater may occur in the unconfined aquifer; each map is accompanied by a description of the availability of freshwater. (Woodard-USGS)

Descriptors: *Rip currents, *Surf, *Waves, Environmental effects, Beaches, *Outer Continental Shelf, *Nearshore processes, Onshore effects, Kinematics.

Simultaneous measurements of sea surface elevation and onshore and alongshore water particle velocities were measured at three locations within the surf zone using two capacitance type penetrating wave staffs and three tow-component electromagnetic flow meters. The probability density functions, pdf, for the sea surface elevation were always highly positively skewed, whereas the pdf's for the velocities were both negatively and positively skewed. Mean values of the onshore and alongshore components of flow reflected the influence of a rip current frequently observed just south of the instrument location. Strong harmonics in the spectra of sea surface fluctuations and particle velocities infer nonlinear conditions. Coherence values between waves and onshore flow were high, ranging above 0.9. The coherence between waves and onshore flow was used to separate the turbulence and wave-induced velocity components. Over the range of collapsing to spilling breakers a reasonable value for the ratio of turbulent to wave-induced velocity was determined to be approximately 0.75. Saturation regions were found in the wave and velocity energy-density spectra at higher frequencies as evidenced by -5 and -3 slopes, respectively. (Sinha-OEIS)

nce the signing of the U.S.-Mexican water trea-s (1944-1973), guaranteeing Mexico 1.5 MAF of olorado River water annually and maintaining nimum salinity levels, U.S. researchers have en developing desalination techniques to make mpliance with these agreements possible. A 60-re desalting test facility has been constructed ur miles west of Yuma, Arizona, with the intent reclaiming drainage water from the Welltton-ohawk irrigation district. Three major objectives the project have been identified: (1) providing ta on desalting models and equipment operated pretreated water from the main conveyance annel, (2) allowing desalting manufacturers to in experience with their equipment, and (3) pro-ding criteria for the evaluation of desalting uipment proposed for the Yuma desalting plant. ght reverse osmosis units and four electrodialysis its have been installed and operated in this facili-to achieve these objectives. Between November 74 and May 1978, these desalting units accumu-ted over 200,000 hours of operating time, and ve been successful in accomplishing most of the jectives of the Colorado River Basin Salinity ontrol Project and provided invaluable design ta relating to specific site problems. REEZE DESALINATION AND CONCENTRA-ION APPARATUS,
. F. Smirnov, V. M. Parkhitko, and V. I. Zverkhovsky.
U.S. Patent No. 4,112, 702, 11 p, 2 fig, 2 tab, 6 ref; Official Gazette of the United States Patent Office, Vol 974, no 2, p 629, September 12, 1978.

Descriptors: *Patents, *Desalination, *Water treatment, *Water purification, Sea water, *Freezing, Desalination processes, Crystallization, Equipment, Heat exchangers, Food processing industry, *Freeze desalination.

The freeze desalination and concentration apparatus may be used for desalination of sea and saline water, for producing high-grade potable distilled water with an output of up to 24 cu.m of distilled water per day on sea going vessels and other vehicles, as well as for water supply systems of small settlements in remote places. It may also be used in the food industry for concentration of various liquid food products. Desalination or concentration of solutions by freezing comprises three basic steps: formation of ice from solution; separation and washing of ice from brine; and ice melting. The desalination unit includes in flow sequence, a three-circuit heat exchanger, a condenser for a refrigerant and for melting the ice mass, and a cylindrical crystallizer having a separator with an auger arrangement mounted inside the crystallizer. An ice-cutting device is accommodated between the crystallizer and separator, and another ice-cutting device is provided between the casing of the desalination unit and the outer ice-forming surface of the crystallizer. Gesellschaft fuer Kernenergieverwertung in Schiffbau und Schiffahrt m.b.H., Geesthacht-Terperhude (Germany, F.R.) (Assignee).
K. W. Boddeker, and W. Hilgendorff.
U.S. Patent No. 4,115,274, 7 p, 6 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 974, No. 3, p. 1490-1491, September 19, 1978.

Descriptors: *Patents, *Desalination, *Water treatment, Saline water, *Reverse osmosis, Membrane processes, *Desalination apparatus.

An apparatus for desalinating seawater by reverse osmosis has a series of porous discs each covered on both sides by a membrane, and compressed at their edges between respective pairs of a stack of module plates which are identical. Each module plates consist of two mirror image halves, alternate module plates in the stack being rotated through 180 degrees. A zig-zag flow path through the stack is thereby provided with desalinated water passing by reverse osmosis into the porous discs and hence radially outward of the stack for collection. 3B. Water Yield Improvement

WATER HARVESTING FOR AFFORESTATION: I. EFFICIENCY AND LIFE SPAN OF ASPHALT COVER,
Research Inst. of Forests and Rangelands, Tehran (Iran).
P. Mehdizadeh, A. Kowsar, E. Vaziri, and L. Boersma.
Soil Science Society of America, Journal, Vol. 42, No. 4, p. 644-649, July-August, 1978. 5 fig, 2 tab, 21 ref.

Descriptors: *Water harvesting, *Asphalt, *Membranes, *Reforestation, *Water spreading, Rainfall-runoff relationships, Soil sealants, Surface runoff, Storm runoff, Water conservation, Water yield improvement, Slopes, Permeability, *Iran.

In Tehran and other large cities in arid regions, officials are interested in fighting atmospheric pollution by establishing city parks and greenbelts. Because insufficient water supplies are available to achieve this task, researchers have been investigating the possibility of collecting rainwater from impervious asphalt-line microwatersheds, both to save water for domestic consumption and to decrease the probability of mass mortality of trees during drought. The technique was investigated on asphalt-lined runoff plots 2 meters wide and 10 meters long, and on 2 meter-wide terraces along contour lines at 5 meter intervals on a 30 percent sloped hillside. Results indicated a runoff efficiency of nearly 75 percent initially on the microwatersheds and high soil water content on the terraces of -.4, -7.7, and -2.5 bars. After four years, however, the asphalt membrane began to deteriorate because of the freezing and thawing of the soil, growth of plants, and shrinking and swelling of clays, resulting in a drop to 25 percent efficiency. Further work, nevertheless, is being carried on to develop this technique as an alternative to conventional irrigation systems for the establishment of greenbelts in arid regions. (Tickes-Arizona)

THE PUBLIC DECIDES ABOUT WEATHER MODIFICATION,
Colorado Univ., Boulder. Human Ecology Research Services.
B. C. Farhar.
Environment and Behavior, Vol. 9, No. 3, p 279-310, September 1977, 9 tab, 33 ref.

Descriptors: *Attitudes, *Decision-making, *Social values, *Social impact, *Artificial precipitation, *Cloud seeding, *Weather modification, *Social research, Agrodimatology, Direct benefits, Indirect benefits, South Dakota Weather Modification Program(SDWMP), National Hail Research Experiment, Rainfall augmentation.

Drawing from several studies, this article examines public attitudes and values toward weather modification programs in general, and cloud seeding in particular. The research, conducted on the social aspects of weather modification, involved two types of major efforts -- the first involved surveys in 6 states focusing on citizen attitudes, opinion, knowledge, and beliefs about cloud seeding, and the second involved monitoring of large project areas in 24 states over a 6-year period between 1969 and 1975. Survey data indicate favorable attitudes toward the concept of weather modification and the effectiveness of cloud seeding, a low level of knowledge about weather modification, and a preference for decision-making and funding of weather modification programs to rest at the state or local level. Although most respondents feel they know little about weather modification programs, they tend to support these programs and to favor enabling legislation. Respondenst do not appear to be too concerned about risk. Most respondents in agricultural area do not exhibit antiscientific or antitechnological bias. They tend to favor modification programs when they preceive direct or indirect economics benefits. Where economic harm might result for some groups while benefiting others, the probability of opposition to a program is increased; where a project has local sponsorship and local support over several years, even a large scale negative weather event (e.g., flash flooding) in the presence of cloud seeding may not produce organized opposition. Organized opposition has resulted in areas where seeding has been blamed for drought conditions. The author presents a number of unresolved questions with regard to weather modification and discusses decision roles. (Arnold-NC)

A REANALYSIS OF THE SKAGIT CLOUD SEEDING PROJECT,
Washington Univ., Seattle. Dept. of Atmospheric Sciences.
P. V. Hobbs, and A. L. Rangno.
Journal of Applied Meteorology, Vol. 17, No. 11, p 1661-1666, November 1978. 9 fig, 1 tab, 2 ref.

Descriptors: *Weather modification, *Cloud seeding, *Analytical techniques, *Washington, Regression analysis, Statistics, Runoff, Rainfall, Precipitation(Atmospheric), Silver iodide, Rivers, Data processing, Meteorology, Projects, *Skagit River(WA), *Skagit Cloud Seeding Project.

In a previous analysis by Hastay and Gladwell (1969) of the Skagit Cloud Seeding Project, the actual runoffs of the Skagit River during the two seeded years were compared to the runoffs predicted by a principal component (or covariate) analysis technique. It was concluded that seeding from ground generators with silver iodide increased the annual runoff of the Skagit River by at least 15% in the second year of the Skagit Project (the 1964 water year), and that this result was significant at the 0.005 (or higher) level. In this paper it was shown that this conclusion cannot be substantiated due to the inclusion in the analysis of a control river which behaved anomalously during the 1964 water year and on which the statistical significance of Hastay and Gladwell's result rests. Comparisons of the runoff of the Skagit river during the 1964 water year with the runoffs of two similarly situated rivers, with which the Skagit is well correlated historically, showed no significant effects due to seeding. SALT OUTFLOWS FROM NEW AND OLD IRRIGATION LANDS,
Snake River Conservation Research Center, Kimberly, ID.
D. L. Carter, and C. W. Robbins.
Soil Science Society of America Journal, Vol. 42, No. 4, p 627-632, July-August, 1978. 3 fig, 3 tab, 13 ref.

Descriptors: *Sainity, *Leaching, Leachate, Drainage water, Water quality, *Salt balance, *Irrigated land, *Salts.

Three water application treatments with low salt water were applied to previously nonirrigated soil and to a similar soil which had been irrigated for 67 years. The total soluble salt content of these soils initially, and after one and two seasons of treatment, was measured to determine salt outflow. Residual soluble salts were essentially removed from the previously nonirrigated soil after 30 cm of water/m depth of soil had passed from the soil as leachate, regardless of the number of seasons required for that amount of leaching. The total quantity of residual salt removed from soil 5 m deep was 70 metric tons/ha, with about 38 metric tons/ha being leached out by the first 14 cm of leachate. After the residual salt was removed, the salt content of the newly irrigated soil was the same as that of the soil which had been irrigated for 67 years. Subsequent salt outflow from the soil was directly related to the quantity of water leaching through the soil, indicating that more minerals dissolved with more leaching. Soils irrigated for many years and then not irrigated for up to 10 years had no measurable reaccumulation of soluble salts during the period of nonirrigatin. (Skogerboe-Colorado State)

Descriptors: *Municipal water, *Water conservation, *Water policy, *Alternatives, Constraints, Pricing, Metering, Education, Programs, National goals.

The municipal water conservation options available to meet the goals of a national water conservation policy are evaluated. Water conservation with water conservation devices offers many significant advantages over education and pricing and metering as methods of accomplishing water conservation goals. Current constraints on the use of water conservation devices are outlined, and their elimination is suggested if the nation's water conservation goals are to be met. (Bell-Cornell)

PLANNING IN SMALL- AND MEDIUM-SIZE ILLINOIS MUNICIPAL WATER SYSTEMS,
Illinois Univ. at Urbana-Champaign.
J. C. van Es, and Richard J. Quigley.
Illinois Agricultural Economics, p. 17-23, January 1976, 7 tab, 12 ref.

Descriptors: *Municipal water, *Illinois, *Cities, *Planning, *Potable water, *Financial information.

This research deals with the planning and financial information aspects of small- and medium size water systems in Illinois; also, the social and organizational factors related to the provision of such a local service. The data are from a sample of 228 Illinois municipal water systems. Attempts to determine the relationships between planning and financial knowledge and municipal and water-system characteristics indicate a general weakness or absence of such relationships, although the relationships were consistently stronger for the municipal characteristics. The historical absence of the necessity to manage the water system other than in a routine fashion may have left these systems unprepared to meet future challenges.

Descriptors: *Water supply, *Cities, *Municipal, *Storage capacity, *Data collections, Facilities, Water use, Human population, Rates, Water requirements, Consumption use.

A current listing of available data on U.S. water supply facilities in communities with a serviced population of over 2,000 is provided. The tabulated data are presented alphabetically by state and alphabetically by community name within the individual states. Statistics are given for: population served, water supply capacity in million gallons/day, average daily use in million gallons, per capital use rate, percent utilization of water supply capacity, and the potential population growth which would not impact on the existing system. THE CLOSED-CYCLE BLEACHED KRAFT PULP MILL,
B E and K, Inc., Birmingham, AL.
G. Rowlandson, and C. F. Cornell.
Appita, Vol. 32, No. 1, p 45-50, July, 1978. 8 fig, 16 ref.

Descriptors: *Kraft mills, *closed systems, *Water conservation, Water pollution sources, Water pollution control, Canada, Foreign countries, Economics, Water reuse, Recycling, Cooling water, Design, Water balance, Salts, Heat balance, Fiber recovery, Chemical recovery, Pulp and paper industry.

The closed-cycle pulp mill eliminates water pollution through internal recycling techniques, the only discharge being clean cooling water. The system also reclaims heat, fiber, and chemicals previously lost in the pulp mill effluent. Important facets of the closed-cycle pulp mill are outlined, and descriptions are given of the closed-cycle mill design (including water balance), closed-cycle counter-current bleach plant, and salt recovery system. The economics of the closed-cycle system are compared to those of external effluent treatment schemes with specific reference to the closed-cycle kraft pulp mill of Great Lakes Paper Co. at Thunder Bay, Ontario. (Swichtenberg-IPC)

NEW SYSTEM IMPROVES STEAM ENERGY USAGE AT TENNESSEE BOX PLANT.
Boxboard Containers, Vol. 86, No. 1, p 45, August, 1978.

Descriptors: *Box plants, *Steam, *Condensates, *Water reuse, *Closed systems, Tennessee, Water pollution sources, Water pollution control, Water temperature, Water pressure, Industrial water, Operation and maintenance, Boilers, Recirculated water, Corrugating machines, Water conservation.

Union Camp Corp. of Morristown, Tennessee, installed a high-pressure steam condensate return system on its corrugator in 1974. It drains the corrugator of condensate and returns it directly to the boiler with a minimum drop in temperature and pressure. A trapless return system was installed in 1977, considerably reducing steam energy consumption and maintenance. In this closed system, automatic maintenance of the pressure differential keeps the system in balance. Condensate is returned to the boiler with little drop in temperature, thereby requiring less energy for corrugator operation. (Louden-IPC)

WATER CONSERVATION AT ELY (PAPER) MILL,
Ely Paper Mills (England).
R. G. Reid.
In: 115th British Paper and Board Industry Federation Conference on the Use of Technology to Improve MillProfitability, March, 1978, London, England, Paper No. 15, 6 p.

Descriptors: *Water conservation, *Pulp and paper industry, Foreign countries, Europe, Water pollution control, Water pollution sources, Turbines, Generators, Electric powerplants, Water treatment, Industrial water, Boiler feed water, Treatment facilities, Water supply, Water costs, England, Ely River(England).

The Ely Paper Mill (Cardiff, South Wales) of Wiggins Teape Ltd. (United Kingdom) is situated along the River Ely. The closing of an iron mine, pumping about 4,000,000 gallons of water per day into the river and the simultaneous substantial increase in the company's license to abstract water from the river prompted Ely Paper Mill to install a 2.3 megawatt back-pressure turbine generator and to modernize the (river) water treatment plant. The treated river water is used as boiler feedwater and for the manufacture of vegetable parchment paper. Even with the drought of 1976 the mill managed to keep production at previous levels with one-half the consumption of water. (Swichtenberg-IPC)

The water circuit of the mill's fourdrinier machine with secondary former manufacturing 100 tons/day of test linerboard and corrugating medium was closed. The system used involves mixing the effluent with a flocculating agent and pumping it to a contact-sludge clarifier with a capacity of 600 cu m, where the solids content is reduced from 1830 to 15 mg/liter at a throughput rate of 3000 liters/min. Fresh water is still added to the mill's process water to make up for the 120 cu m of water evaporated daily by the paper machine drying cylinders. (Speckhard-IPC)

Pima (Paper Industry Management Association) Magazine, Vol. 60, No. 8, p. 23-29, August 1978. 3 fig, 9 ref, 6 tab.

Descriptors: *Water conservation, *Kraft mills, *Water pollution control, *Closed systems, Water pollution sources, Operation and maintenance, Canada, Foreign countries, Pulp wastes, Bleaching wastes, Foaming, Pulp and paper industry, Salts, Corrosion, Equipment, Spill control, Black liquor, Condensates, Recycling.

Problems encountered, their solutions, and the operating results to date are reviewed following the startup of the salt removal process in March 1977 at the closed-cycle bleached kraft market pulp mill of Great Lakes Paper Co. Ltd. in Thunder Bay, Ontario. Flowsheets and brief descriptions are presented for the bleach plant filtrate recovery system, the closed brown stock screening and brown decker-washer system, and the salt recovery operations. The spill control system and stripping of black liquor evaporator condensates are also discussed. Corrosion of the recovery furnace precipitator and bleach plant towers, foaming in the bleach plant and brown stock decker seal tanks, and an increase in chemical consumption in the D/C and D-1 bleaching stages (D = chlorine dioxide and C = chlorination) have been noted. (Swichtenberg-IPC)

RESPONSIVENESS OF SOIL EROSION LOSSES IN THE CORN BELT TO INCREASED DEMANDS FOR AGRICULTURAL PRODUCTS,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
D. C. Cory, and J. F. Timmons.
Journal of Soil and Water Conservation, Vol 33, No 5, p 221-226, September 1978. 1 fig, 4 tab, 24 ref.

Descriptors: *Erosion, *Iowa, *Illinois, *Corn belt, Soil erosion, Agriculture, Export, Economics, Equations, Model studies, Soil losses, Soil erosion losses, Regional model, Universal soil loss equation.

The estimated soil erosion losses resulting from increased agricultural production between a base period, 1969-1971, and 1985 in 12 Corn Belt states under two future scenarios were examined. These scenarios are composed of alternative sets of export demands, land management and eroson control practices, product prices, and farm policies. Scenario I, which assumes a continuation of historical trends, results in a 17% increase in planted crop acres and a 39% increase in soil erosion losses. These losses vary from 68% in Iowa to 8% in Kansas. Scenario II, featuring increased production because of higher exports, results in a 29% increase in planted crop acres and a 72% increase in soil erosion losses. The losses in this case vary from 106% in Iowa to 40% in Illinois. (Lee-ISWS)

ROW SPACING AND DIRECTION EFFECTS ON WATER UPTAKE CHARACTERISTICS OF PEANUTS,
Oklahoma State Univ., Stillwater.
E. W. Chin Choy, J. F. Stone, and J. E. Garton.
Soil Science Society of America Journal, Vol. 41, No. 2, p 428-432, March-April, 1977. 5 fig, 2 tab, 14 ref.

Descriptors: *Evapotranspiration, *Peanuts, Crop response, Crop production, *Cultivation, *Row spacing, Water utilization.

Peanuts grown in 30-cm wide, north-south rows, lost less water to evapotranspiration than those grown in 90-cm rows or than east-west rows of these spacings. Plants grown in 90-cm wide, north-south rows tended to have the highest water losses. The reason for this phenomen was not determined, although there is reason to believe net radiation is lower in narrow rows than wide. Yield of peanuts was enhanced by the narrow rows and no orientation effect on yield was noted. This, water-use efficiency was increased by both yield effect and water conservation effect. Peanut quality was the same for all treatments. There is no reason to believe that the water conserving effect is unique to peanuts. Research on other crops in similar geometries is to be encouraged. A 'NEW WEST' RECLAMATION TRAGEDY, THE TWIN FALLS-OAKLEY PROJECT IN IDAHO, 1908-1931,
Boise State Univ., ID.
H. T. Lovin.
Arizona and the West, Vol. 20, No. 1, p. 5-24, Spring 1978. 4 fig, 30 ref.

Descriptors: *History, *Irrigation districts, *Idaho, *Reclamation states, *Land reclamation, Political aspects, Social aspects, Legislation, Water rights, Project feasibility, Economic impact, *Twin Falls-Oakley Project(Ida), Snake River plain(Ida).

Under the Newlands and Carey Acts, the sparsely inhabited arid regions west of the Rockies became known at the turn of the century as the New West, the site of dozens of Federal and state reclamation projects. One such, the Twin Falls-Oakley project on the study of the difficulties of settling this uncertain landscape, unfamiliar to its new settlers. In this historical account we learn that the project was speedily approved by the Idaho Land Board and 43,893 acres segregated for construction of irrigation works capable of serving the region, with the promoters obtaining the rights to sell water rights and services to the area's farmers. The district opened in 1909 with high expections on the part of investors risking sums calculated between one and a half and two and a quarter million dollars. But misfortune and bad planning beset the project from the beginning. The lack of proper soil, geological, or water studies, together with engineering miscalculations caused long delays and serious physical problems, which in turn precipitated financial and political difficulties that haunted the district until 1931 when litigation ceased with practically everybody the loser. Implications for subsequent reclamation project can be read into the details of this early disaster. (Tickes-Arizona)

ISRAEL: WHERE IRRIGATION IS AN ART,
R. Ross.
Irrigation Age, Vol. 13, No. 2, p 66-68, October, 1978. 3 fig.

Descriptors: *Irrigation operation and maintenance, *Irrigation systems, *Irrigation practices, Distribution systems, Computer programs, Water conservation, Labor supply, Management, *Israel.

A coordinated irrigation control system at Kibbutz Saad in Israel is described. The system, including its master control station, field units, and electric solenoids has greatly reduced irrigation labor requirements for this and other settlements in this small progressive country. The operation and function of the system, developed by Motorola Israel

td. is described, from the initial decision to com-
uterize to the release of water and the trouble-
ooting abilities of the field units. In addition to
inimizing labor and error, the system has been
ound to aid in water conservation and utilization
forts, help produce higher yields, and refine man-
gement techniques. (Tickes-Arizona)

FLUSH-DRIP IRRIGATION EMITTER,
I. H. Christy, and L. Spencer.
J.S. Patent No. 4,113,180, 5 p, 12 fig, 6 ref; Official
Gazette of the United States Patent Office, Vol
74, no 2, p 792, September 12, 1978.

Descriptors: *Patents, *Irrigation, *Irrigation prac-
ces, *Irrigation efficiency, Flow control, Appli-
ation equipment, Flush-drip irrigation.

A flush-drip irrigation emitter includes a compact
mitter element, a housing enclosing the emitter
lement and an insect guard. The emitter element
as a pair of confronting oppositely arched flexible
alls defining a flush flow passage with sharp
ateral edges. One of the walls has at least one drip
uct, the walls being responsive to a minimal pres-
ure difference to collapse against each other in
utual sealing relation and confine flow to the drip
uct. The housing includes telescopable comple-
entary housing components provided with an
let connected to a water supply and an outlet.
he emitter element includes sealing means inter-
osed between the housing components. The hous-
ng components have mutually engageable latch
lements and a tool receiving channel to effect
eparation. The outlet is arranged to receive direct-
y or indirectly through a small irrigation tube, and
nsect guard. (Sinha- OEIS).

HIGH RISE SPRINKLERS,
K. T. Sheets.
U.S. Patent No. 4,113,181, 10 p, 8 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 974, no 2, p 793, September 12, 1978.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, Irrigation practices, Irrigation efficiency, Nozzles, Application equipment, Floats, Water delivery.

High rising projectable sprinklers rise automatically from the ground when water is supplied under pressure to the sprinklers. The projectable sprinklers include a generally cylindrical housing closed at the bottom and sunken in the ground. A projectable float floats upward within the housing when water is supplied under pressure to the sprinkler. The sprinkler head includes a rotating nozzle or nozzles attached to the top of the float. (Sinha - OEIS)

STUDIES ON THE USE OF COAGULATION AIDS FOR TREATMENT OF BOILER FEED-WATER (CERCETARI PRIVIND UTILIZAREA ACCELERATORILOR DE COAGULARELA TRATAREA APELOR DE ALIMENTARE A CAZANELOR),
F. Nichifor.
Celuloza si Hirtie, Vol. 26, No. 4, p 162-167, October-December, 1977. 2 fig, 8 tab.

Descriptors: *Boiler feed water, *Water treatment, *Coagulation, Industrial water, Silica, Iron, Hardness(Water), Water softening, Polyacrylamide.

Laboratory studies are reported on the comparative efficiency of several nonionic and anionic commercial coagulants of the Medasol type, as well as of experimental nonionic and anionic, hydrolyzed and nonhydrolyzed polyacrylamide preparations, for the removal of silica, iron, and hardness components from high-pressure boiler feedwaters. (Brown-IPC)

RESPONSE OF CORN TO ZN IN ORTHO- AND PYROPHOSPHATE FERTILIZERS, AS AFFECTED BY SOIL TEMPERATURE AND MOISTURE,
National Fertilizer Development Center, Muscle Shoals, AL.
P. M. Giordano, and J. J. Mortvedt.
Agronomy Journal, Vol. 70, No. 4, p 531-534, July-August, 1978. 2 fig, 2 tab, 8 ref.

Descriptors: *Fertilizers, *Phosphates, Sweet corn, *Zinc, Phosphorus, *Soil temperature, *Soil moisture, Crop response, Plant growth, *Corn.

The purpose of this investigation was to determine the effects of both soil temperature and moisture regimes on the uptake of Zn and P by corn (Zea mays L.) from ZnSO4, granulated with ammonium ortho- and polyphosphate fertilizers and applied to Nolichucky scl (pH 7.6), a Typic Paleudult soil. In a series of greenhouse experiments, corn grown under various soil temperature (16 to 32C) and moisture regimes (0.3 to 0.15 atm) showed a marked reduction in dry matter yield, as well as in Zn and P uptake, at low temperature, but varying soil moisture levels had little effect. Uptake of Zn was greater when triammonium pyrophosphate rather than monoammonium phosphate was the source of applied P, but uptake of P from the two P sources was comparable. Although lower Zn uptake appears to be a function of depressed growth under cool soil conditions, it is likely that deficiency arises because early Zn requirements cannot be met when the available Zn supply is low. Uptake and yield results further suggest that early growth retardation sometimes attributed to Zn devidiency during cool springs also may be related to suppression of P uptake. SUGARBEET GENOTYPE, N, AND SOIL MOISTURE AVAILABILITY INTERACTIONS IN COMPONENTS OF BEET YIELD AND QUALITY,
Utah State Univ., Logan. Dept. of Applied Statistics and Computer Science.
D. W. James, D. L. Doney, J. C. Theurer, and R. L. Hurst.
Agronomy Journal, Vol. 70, No. 4, p. 525-531, July-August, 1978. 8 fig, 2 tab, 16 ref.

Descriptors: *Sugar beets, *Nitrogen, *Soil moisture, Crop response, *Crop production, Varieties.

This study was conducted to investigate the genotype of sugarbeet (Beta vulgaris L.) X soil N and genotype X soil water interaction from a broad genetic base. A series of 20 genetically different genotypes differing in yield, sugar percent, and impurity index potential were field tested in 1974 at four N levels: 0, 84, 210, and 525 kg/ha. In 1975, eight genetically diverse genotypes were field tested at five N levels and four irrigation levels. The soil type was a coarse, loamy mixed mesic family of calcic haploxerolls. Analysis of data were for root yield, sucrose percent, gross sugar, and impurity index. Highly significant main effects due to N in 1974 and 1975 and water in 1975 were observed for all measured parameters. A significant genotype (V) X (N) interaction was obtained in 1974 for all parameters. There was an apparent genotype X water interaction in 1975; however, unbiased statistical inferences could not be made because of the experimental design. These interactions indicate that genetic variation exists such that new cultivars may be developed that give high sugar production at low N levels or are not affected adversely in quality at a high N level. YIELDS, NUTRIENT REMOVAL, AND NUTRIENT CONCENTRATIONS OF DOUBLE-CROPPED CORN AND SMALL GRAIN SILAGE,
Kentucky Univ., Lexington. Dept. of Agronomy.
L. W. Murdock, and K. L. Wells.
Agronomy Journal, Vol. 70, No. 4, p 573-576, July-August 1978. 7 tab, 7 ref.

Descriptors: *Sweet corn, *Barley, *Oats, *Silage, Crop response, Crop production, Nutrient removal, *Kentucky.

The study was initiated to determine production levels from double-cropped silage, the most compatible small grain species for double-cropped silage, and the rate and method of fertilizer application needed for high production. Field experiments were established on Huntington (fine-silty, mixed mesic fluventic Hapludoll) and Pope (coarse-loamy, mixed, mesic fluventic Dystrochrept) soils. Three fertility levels were tested with 392-128-280, 280-89-232, or 168-54-140 kg/ha of N-P-K being applied each year. Single and split applications of K were studied. Barley (Hordeum vulgare L.) and oats (Avena sativa L.) were compared as small grain species. This study indicates that double-cropped corn and small grain for silage can

result in substantially higher dry matter production per unit land area than single-cropped corn. Large amounts of minerals are removed, however, particularly K, by the smal grain component of the double-cropping system. (Skogerboe-Colorado State)

DEPENDABILITY OF SELF-PROPELLED SPRINKLER SYSTEMS,
Colorado State Univ., Fort Collins. Environmental Resources Center.
J. W. Addink.
Irrigation Journal, Vol. 1, No. 2, p 18-19, March-April 1971. OWRT B-039-COLO(8).

Descriptors: *Center-pivot sprinklers, *Sprinkler systems, Automatic irrigation system, Performance.

Center-pivot sprinkler systems have become very popular in the past ten years. However, several center-pivot companies have failed and nearly every company in the business has had failures on individual installations. Four areas play essential roles in determining the success of the systems and the companies manufacturing and selling them. The four areas are: design, sales, setup and service. Each of these areas is discussed.

ANALYZING HYDROLOGIC UNCERTAINTY AND ITS IMPACT UPON DECISION MAKING IN WATER RESOURCES,
Princeton Univ., NJ. Dept. of Civil Engineering.
E. F. Wood.
Advances in Water Resources, Vol. 1, No. 5, p 299-305, September 1978. 4 fig, 2 tab, 23 ref.

Bayesian Inference and Decision Theory tools are applied to the problem of synthetic hydrology when model and parameter uncertainty exist. Issues such as optimal parameter estimation, use of synthetic generation in design problems, and the effects of parameter uncertainty on statistical estimation are discussed and applied to the problem of reservoir storage-yield analysis. It is concluded that parameter and model uncertainty arising from short hydrologic records can have a significant influence upon water resource designs. The decision theory approach will allow an analyst to develop statistical estimators in conjunction with the engineering decision problem at hand, leading to better designs than if the traditional approach were taken. (Bell-Cornell)

INTER-DISTRICT WATER ALLOCATIONS VIA LINEAR PROGRAMMING AND LINEAR PROGRAMMING DECOMPOSITION,
Iowa Univ., Iowa City, Inst. of Hydraulic Research.
M. Seki, and T. E. Croley, II.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 942, Price codes: A11 in paper copy, A01 in microfiche. IIHR Report No. 207, September 1977. 214 p, 10 fig, 77 tab, 28 ref, 2 appen.

Descriptors: *Water allocation(Policy), *Linear programming, *Watersheds(Basins), *Decomposition technique, *Yamato River basin(Nara, Japan), *Cost minimization, Economic feasibility, Political aspects, Environment, Constraints, water management(Applied), Equations, Mathematical models, Systems analysis, Human factors.

An interdistrict water flow table is developed to account for all water flows within a river basin and to identify all water-related variables for analysis. Linear models are identified for hydrologic variables, environmental variables, human factor variables, water use and water demand. Formulations of economic, political, environmental and population objectives are made along with the constraint formulations of these objectives. Several models of water allocations are thus available with the main objective expressed in the objective function and with all others in constraint form. The equations of continuity and motion are also encapsulated in the model. A case study of the Yamato River basin in Nara, Japan is made, and both linear programming and linear programming decomposition are applied as tools in the minimization of total cost. The final optimum allocation differs little from th existing allocation, indicating the present system is near-optimum with respect to total cost. The decomposition principle application allows for useful insight into decentralized decision making, although it proved to be a poorer tool for analysis in the example. The linear programming formulation and the computer program for analysis with the decomposition principle are presented. (Bell-Cornell)

A NONLINEAR PROGRAMMING ALGORITHM FOR REAL-TIME HOURLY RESERVOIR OPERATIONS,
California Univ., Los Angeles. Dept. of Engineering Systems.
W. S. Chu, and W. W-G. Yeh.
Water Resources Bulletin, Vol. 14, No. 5, p 1048-1063 October 1978. 2 fig, 3 tab, 31 ref.

Descriptors: *Reservoir operation, *Optimization, *Multiple-purpose projects, *Hydroelectric power, *Nonlinear programming, Real-Time, Decision making, Constraint, Methodology, Regression analysis, Reservoir storage, Mathematical models, Systems analysis, Equations, Power output maximization, Lagrangian procedures, Schedule, Shasta Reservoir(Calif), Hourly, *California.

The optimization of real-time operations for a single reservoir system is studied. The objective is to maximize the output of hourly power generation over a period of one day subject to constraints on hourly power schedules, daily flow requirements for water supply and other purposes, and the limitations of the facilities. The problem has a nonlinear concave objective function with nonlinear concave and linear constraints. Nonlinear Duality Theorems and Lagrangian Procedures are applied to solve the problem where the minimization of the Lagrangian is accomplished by a modified gradient projection technique along with an optimal step size determination routine. The dimension of the problem in terms of the number of variables and constraints is reduced by elimating the 24 continuity equations with a special implicit routine. A numerical example is presented using data provided by the Bureau of Reclamation, Sacramento, California. (Bell-Cornell)

OOD PLAIN INFORMATION: ALLEGHENY
VER, POTTER COUNTY PENNSYLVANIA.
my Engineer District, Pittsburgh, PA.
epared for Potter County Planning Commission,
., July 1977. 35 p, 11 fig, 10 plates, 7 tab.

scriptors: *Pennsylvania, *Allegheny
ver(PA), *Flood data, *Peak discharge, Floods,
lirect flood measurement, Flood forecasting,
od profiles, Historic floods, Flood stages,
od peak, Flow duration, Stage-discharge rela-
ns, Flood protection, Non-structural alterna-
es, Warning systems, Control structures, Chan-
improvement, Potter County(PA),
udersport(PA), 100-year flood, 500-year flood,
ulette(PA).

e study area is the flood plain of the Allegheny
ver within the limits of Potter County. The
odplain in Potter County is generally flat con-
ing primarily of farmland, wetland, and low-
d. The communities of Coudersport and Rou-
te have significant residential and industrial de-
opment within the flood plain. Flood data were
tained from an Army Corps Wire Weight Gage,
ging records for similar drainage basins and his-
ical records. The major flood season is from
ecember to April, resulting from heavy rain and
w melt. Large floods can occur at any time.
ere are no flood control dams or reservoirs
ecting floods in Potter County, but a channel
provement project was built by the Common-
alth of Pennsylvania, designed to accomodate a
charge of 10,000 cubic feet per second (cfs) with
minimum of bank overflow. The maximum
own flood occurred at Roulette in July 1942,
th a discharge of 18,500 cfs, reaching a high
ter mark of 1532.5 feet above mean sea level
sl). At the same location the 100-year frequency
od would discharge 18,000 cfs and crest at 153.1
t msl, and the 500-year frequency flood would
charge 28,000 cfs and reach an elevation of
32.9 feet msl. Several bridges in the area would
submerged during high flows, and three are
structive to flood flow. This report provides a
table basis for the adoption of land use controls
guide flood plain development. (Coan-NC)

LOOD PLAIN INFORMATION: WHITE
VER, SECOND BRANCH, THIRD BRANCH
ND AYERS BROOK, RANDOLPH AND
ETHEL, VERMONT.
my Engineer District, Waltham, MA.
ecember 1973, 30 p, 14 fig, 22 plates, 6 tab.

escriptors: *Vermont, *Flood data, *Peak dis-
arge, Floods, Flood flow, Indirect flood mea-
rement, Flood forecasting, Flood profiles, His-
ric floods, Flood frequency, Flood stages, Stage-
scharge relations, Flood protection, Non-struc-
ral alternatives, Warning systems, Land use,
ontrol structures, Dam, Reservoirs, Standard
oject Flood, *White River(VT), Randolph(VT),
thel(VT), Ayers Brook(VT), Intermediate Re-
onal Flood.

ne study area includes the White river basin, the
cond Branch, and Third Branch tributaries and
yers Brook. The flood plains of the study area
e relatively narrow and the majority of the land
equally divided between woodlands and agricul-
ral areas. Flood data were obtained from three
S. Geological Survey gaging stations, historic
cords, and topographic maps. Major floods in
e White River Valley have occurred during all
asons of the year except mid-winter. The most
vere floods generally result from intense rainfall.
A major multipurpose dam and reservoir project was authorized as early as 1936, but it is listed in an inactive status. The highest flood on the White River at Bethel occurred in September 1938 with a peak discharge of 32,200 cubic feet per second (cfs); and at West Hartford the worst flood occurred in 1927, discharging 120,000 cfs. The most severe flood recorded on Ayers Brook at Randloph occurred in June 1973, with a peak discharge of 4,070 cfs. Future flood peak discharges for the White River near Bethel would be 64,000 cfs for the Intermediate Regional Flood (IRF) and 103,000 cfs for the Standard Project Flood (SPF). IRF discharges for the Second Branch and Third Branch tributaries occurring at their mouths would be 15,000 cfs and 29,000 cfs, respectively, and the SPF discharges would be 25,000 cfs and 49,000 cfs, respectively. This report provides baseline information for developing a comprehensive flood management program. (Coan-NC)
W79-03159

FLOOD PLAIN INFORMATION: PASSUMPSIC AND MOOSE RIVERS, TOWN OF ST. JOHNSBURY, VERMONT.
Army Engineer District, Waltham, MA.
Prepared for Town of St. Johnsbury, December 1972, 25 p, 10 fig, 12 plates, 7 tab.

Descriptors: *Flood data, *Peak discharge, *Vermont, Floods, Indirect flood measurement, Flood forecasting, Historic floods, Flood frequency, Flood stages, Flood peak, Flood damage, Ice jams, Flood protection, Non-structural alternatives, Flood plain zoning, Warning systems, Land use, Planning, Zoning, Standard project flood.

The study area is the portion of the town of St. Johnsbury, Vermont subject to flooding from the Passumpsic and Moose Rivers. Land use in the flood plains is residential, industrial, and commercial; severe damage has occurred in past floods. Flood data were obtained from four U.S. Geological Survey gauging stations, interviews with local residents, historical records and maps. Major floods occur during all seasons, but the main flood season is Spring. Major causes of floods are a combination of heavy rainfall, snowmelt and ice jamming. There are no existing flood control projects. The highest flood stages on the Passumpsic River were recorded at Passumpsic, VT in November 1927, with an estimated peak discharge of 42,500 cubic feet per second (cfs), cresting at 521.5 feet mean sea level (msl). The worst flood on the Moose River occurred at St. Johnsbury in March 1936, discharging 4,780 cfs, and cresting at 590.7 feet msl. The Intermediate Regional Flood (IRF) on the Passumpsic River (at River Mile 8) and the Moose River (at the mouth) would discharge 33,000 cfs and 11,000 cfs, respectively, while the Standard Project Flood (SPF) would discharge 59,000 cfs and 16,000 cfs, respectively. This report offers a suitable basis for the adoption of land use controls to guide flood plain development. (Coan-NC)
W79-03160

FLOOD PLAIN INFORMATION: WEST BRANCH AND FARMINGTON RIVER, CANTON, NEW HARTFORD, AND BARKHAMSTED, CT.
Army Engineer District, Waltham, MA.
May 1977, 35 p, 19 fig, 17 plates, 6 tab.

Descriptors: *Connecticut, *Flood data, *Flood protection, *Non-structural alternatives, *West Branch(CT), Farmington(CT), Floods, Indirect flood measurement, Flood forecasting, Historic floods, Flood frequency, Flood stages, Peak discharge, Flood peak, Stage-discharge relations, Flood plain insurance, Flood plain zoning, Warning systems, Building codes, Land use, Planning, Zoning, Control structures, Dams, Reservoirs, Still River(CT), 100-year flood, Flood plain management, Canton(CT), New Hartford(CT), Barkhamsted(CT).

The study area includes the Farmington River Basin and its West Branch, and the Still River, both near the towns of Canton, New Hartford, and Barkhamsted, Connecticut. State park and forest recreation areas make up approximately 40% of the Farmington flood plain near Barkhamsted. Near Canton, the flood plain is primarily used for agriculture or is a wooded area. In the New Hartford area, residential, commercial, and industrial developments are extensive along the Farmington River. Flood data were obtained from U.S. Geological Survey gaging stations, maps, historic records, and interviews with local residents. Three dams designed for flood control and low flow augmentation have been constructed by the New England Corps in the Farmington River drainage basin. The worst flood on the Farmington River was recorded at the Riverton, Connecticut gaging station in August 1955 discharging 81,000 cubic feet per second (cfs) and cresting at 492.5 feet above mean sea level (msl). Torrential rains were cited as the primary cause of this flood. The greatest flood on the Still River was recorded at the Robertsville gage, reaching a peak discharge of 44,000 cfs at an elevation of 527 feet mean sea level. At the Riverton gaging station, peak flows for the 100-year flood would be 21,000 cfs cresting at 483.2 feet msl, and for the 500-year flood peak flows would be 47,000 cfs, cresting at 489 feet msl. Guidelines are presented for flood plain management. The main purpose of this report is to provide guidance for intelligent land use in the river basin. (Coan-UNC)
W79-03161

FLOOD PLAIN INFORMATION: CONNECTICUT RIVER, WEST RIVER AND WHETSTONE BROOK, BRATTLEBORO, VT.
Army Engineer District, Waltham, MA.
Prepared for the Town of Brattleboro, VT, January 1972. 42 p, 8 fig, 15 plates, 6 tab.

Descriptors: *Vermont, *Flood profiles, *Flood data, *Peak discharge, *Flood protection, *Connecticut River(VT), Brattleboro(VT), *Whetstone Brook(VT), Floods, Indirect flood measurement, Flood forecasting, Historic floods, Flood frequency, Flood stages, Flood peak, Stage-discharge relations, Channels, Ice jams, Non-structural alternatives, Flood plain zoning, Warning systems, Land use, Control structures, Dams, Reservoirs, Standard Project Flood, Intermediate Regional Flood.

The study area includes the Connecticut River flood plain near Brattleboro, VT, West River flood plain, and the watershed around the Whetstone Brook. Only the Whetstone Brook flood plain has any significant development consisting of residential and a small amount of commercial development. Flood data were obtained from photographs, newspaper clippings, historical records, topographic maps, and stream gage records. Flooding along the West River has been significantly reduced since 1960 by the construction of flood control structures at Ball Mountain and Townshend. Whetstone Brook is presently unregulated, and flooding can occur within this basin at any time. The combination of storage behind 5 flood-control structures and upstream from power dams reduces most flood peaks on the Connecticut River near Brattleboro to a manageable level. Flood problems along the West River arise primarily from ice jamming near the mouth of the river. The worst flood recorded on the West River occurred in September 1938 near Newfane, discharging 52,300 cubic feet per second (cfs). Flooding along Whetstone Brook results from a combination of rapid snow melt and warm rain, or by heavy rain alone. One bridge would be obstructive to major floods. The worst recorded flood along the Connecticut River occurred in March 1936, discharging 176,000 cfs. The Intermediate Regional Floods would occur as follows: on the Connecticut River near Vernon Dam discharging 140,000 cfs; on West River near its mouth discharging 30,000 cfs; and on Whetstone Brook near its mouth discharging 7,200 cfs. This report has been prepared to provide basic technical information about flood plain hazards and to serve as a basis for land use planning and management decisions concerning flood plain utilization. (Coan-NC)
W79-03162

Field 4—WATER QUANTITY MANAGEMENT AND CONTROL

Group 4A—Control Of Water On The Surface

FLOOD PLAIN INFORMATION: CONNECTICUT RIBER, WEST RIVER, DUMMERSTON, VT.
Army Engineer District, Waltham, MA.
April 1977, 40 p, 13 fig, 17 plates, 6 tab.

Descriptors: *Vermont, *Flood profiles, *Flood data, *Peak discharge, *Connecticut River(VT), *West River(VT), Floods, Indirect flood measurement, Flood forecasting, Historic floods, Flood frequency, Flood stages, Stage-discharge relations, Rivers, Watersheds, Flood protection, Non-structural alternatives, Flood plain zoning, Flood plain insurance, Warning systems, Land use, Planning, Zoning, Control structures, Dams, Reservoirs, Dummerston(VT), 100-year flood, 500-year flood, Encroachment limits, Flood plain management.

This report presents baseline data for planning officials interested in using land use management techniques to guide flood plain development and prevent intensification of areas where other flood damage reduction techniques (such as works to modify flooding, and adjustments including flood proofing) might be used in an overall flood plain management program. The report covers the town of Dummerston, Vermont, which is subject to flooding from the Connecticut and West Rivers. Land use is primarily residential and agricultural. Flood data were obtained from three U.S. Geological Survey gaging stations, historical records, topographic maps, and weather records. Spring and fall are the major flood seasons, with flooding caused by snow melt and heavy rains. Tropical storms also cause flooding. Various flood control measures have been undertaken, including construction of 16 dams and reservoirs and enactment of various land use control measures. The greatest flood of record on the Connecticut River occurred in March 1936, discharging 176,000 cubic feet per second (cfs) and cresting at 222.9 feet above mean sea level (msl). On the West River, the largest flood occurred in 1938, discharging 52,300 cfs and cresting at 407 feet msl. More recent large floods occurred in 1960 and 1973. On the Connecticut River, the 100-year flood would discharge 132,000 cfs, and the 500-year flood, 172,000 cfs. Areas of possible future floods are shown by maps, photographs, profiles, and cross-sections. A glossary of relevant terms is provided to clarify information in the report. (Coan-NC)

Descriptors: *Hydrologic data, *Arid climat
*Utah, *Water quality, *Available water, Surfa
waters, Ephemeral streams, Groundwater, Wat
wells, Water yield, Water utilization, Hydrolog
budget, Desert basins, Western Utah.

The Fish Springs Flat area includes about 5
square miles in western Utah. Total annual preci
tation on the area averages about 7 inches a
totals about 232,000 acre-feet. Fish Springs Wash
the major drainage in the area; and, along wi
numerous smaller washes, it flows only in dire
response to precipitation. Runoff from the area
estimated to be about 2,000 acre-feet per ye
Ground-water recharge from precipitation is abo
4,000 acre-feet annually. Ground-water dischar
is chiefly by springs and evapotranspiration. T
largest springs in the Fish Springs group dischar
about 26,000 acre-feet annually. All other sprin
discharge about 600 acre-feet per year, or ov
about 2 percent of the total spring discharge. D
charge by evapotranspiration is about 8,000 ac
feet per year. Discharge by wells and by subsu
face outflow is negligible. The difference betwe
discharge and local recharge-approximately 31,0
acre-feet--is assumed to enter the Fish Springs F
area by interbasin flow. The estimated amount
water recoverable from storage in the upper 1
feet of saturated valley fill is about 550,000 ac
feet; and most of this water is slightly to moderat
ly saline. The water in the Fish Springs Flat ar
ranges from slightly saline to briny; and the pr
dominant ions in the water are sodium and chl
ride. The water that underlies the mudflats in t
northwest part of the area is briny. Water th
issues from Fish Springs is slightly saline. T
water in the area is not suitable for drinking. T
water that issues from Fish Springs is used f
wildlife management, which includes ponding a
irrigation of vegetation (chiefly saltgrass) in t

ish Springs National, Wildlife Refuge. The water om the wells in the area is used for livestock and ining operations. (Woodard-USGS)

Descriptors: *Remote sensing, *Perched water, *Infrared radiation, *Thermal radiation, Electromagnetic waves, Water table, Monitoring, Test wells, Irrigation effects.

The existence of shallow perched water tables associated with agricultural activities affects arid environments. This problem is usually related to irrigation water where percolation is impeded by a low permeable layer within the soil profile. Current methods for detection and monitoring of these tables involve test well drilling and monitoring programs that are both costly and time consuming. Remote sensing techniques have demonstrated well siting and monitoring capabilities and have potential timeliness and cost effectiveness characteristics. This study focuses upon remote sensing techniques within the spectral range 0.4 microgram to 23 cm of the electromagnetic spectrum. Imagery from the visible and reflective infrared (aerial camera and Landsat scanner), thermal infrared (aircraft scanner) and microwave (both active L-band and passive 35 GHz micrad) region have been analyzed. Significant temporal cycles in seasonal fluctuations as well as crop growth stages play important roles in establishing the utility of sensor systems to detect vegetative response to perched water tables. A full year of Landsat data proved useful for assessing vegetative responses, however, low precipitation rates in arid regions and the masking effects of irrigation may limit its use. Results indicate that the thermal infrared region has unique detection capabilities because of differential subsurface heat flows associated with the presence of perched water tables. Temporal aspects are especially important to thermal data collection because of diurnal, seasonal and yearly dynamics of heat fluxes. (Snyder-California)

All available information on production wells used for public groundwater supplies in Pulaski County, Illinois, was presented. The definition of public water supply is contained in the Environmental Protection Act of 1970 was used to determine those water systems and wells to be included. The report included separate descriptions for groundwater supplies of 6 municipalities. These were preceded by brief summaries of the groundwater geology of the county and the development of groundwater sources for municipal use. Individual production wells for each supply were described in the order of their construction. The description for each well included the aquifer tapped, date drilled, depth, driller, legal location, elevation in feet above mean sea level, log, construction features, yield, pumping equipment, and chemical analyses. Journal of Arid Environment, Vol. 1, No. 3, p. 275-287, 1978. 5 fig, 2 tab, 13 ref.

Descriptors: *Groundwater basins, *Alternative planning, *Water management(Applied), *Arizona, Water resources development, Water supply development, Inter-basin transfers, Water rights, Non-structural alternatives, *Santa Cruz River basin(Ariz).

This analysis covers the water budget of Arizona in general, and of the Santa Cruz Basin in particular. The City of Tucson is used to illustrate the typical manner in which urban communities in arid regions become totally dependent upon underlying and nearby aquifers for their water. Water withdrawals from both the Avra and Santa Cruz River basins for urban, agricultural, industrial, and mining uses are shown to exceed natural aquifer replenishment by 5676 hectare meters annually. Four water resources management alternatives for reducing groundwater level decline in the Santa Cruz Basin are presented and described: (1) importing water from the Colorado River, (2) exchanging municipal sewage effluent with mines or farms for their fresh water rights, (3) interbasin transfer of water, and (4) retiring farmlands for water rights. These techniques used either singly or in combination must be based on the economic and physical characteristics of the area. It is suggested that the alternatives discussed here have application in similar arid regions throughout the world. (Tickes-Arizona)

A METHOD FOR THE ANALYSIS OF DRAWDOWN FROM MULTIPLE-SOURCE TEST PUMPING,
Southern Water Authority, Eastleigh (England). Directorate of Resource Planning.
T. Keating.
Journal of Hydrology, Vol. 39, No. 1/2, p 185-191, October 1978. 2 fig, 1 tab, 5 ref.

Descriptors: *Drawdown, *Pump testing, Analysis, *Least squares method, Transmissivity, Storage coefficient, Aquifer characteristics, Observation wells, Equations, Theoretical analysis, On-site data collections, Wells, Pumping, Computer models, *Multiple-source pumping test.

Presented herein was a method for the computation of transmissivity and storativity from drawdown data measured in an observation well during a multiple-source test pumping in an isotropic homogeneous nonleaky aquifer. The method uses the principle of least squares to obtain the best fit between the observed and predicted drawdowns. A field example was used to illustrate the application of the method. THE HYDROTHERMAL SYSTEM OF LONG VALLEY CALDERA, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
M. L. Sorey, R. E. Lewis, and F. H. Olmsted.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $2.50. Professional Paper 1044-A, 1978. 60 p, 34 fig, 1 plate, 17 tab, 112 ref.

Descriptors: *Geothermal studies, *California, *Model studies, *Heat flow, *Thermal water, Water temperature, Mathematical models, Numerical analysis, Hydrologic properties, Geochemistry, Aquifer characteristics, Hot springs, Depth, Test wells, Evaluation, *Long Valley caldera(Calif), Groundwater reservoir.

Results of previous investigations by the U.S. Geological Survey and limited information from a recently drilled 2.11-km-deep test hole in Long Valley caldera, California, enable a useful conceptual model of the hydrothermal system to be developed. The results obtained from numerical simulations with this model permit a useful determination of a general relation between heat flow and the depth and duration of fluid flow, as well as the effective hydraulic characteristics of the hydrothermal reservoir. The conceptual model is based largely on the following information from previous studies. Seismic-refraction experiments and geological investigations delineate three major rock units: (1) a near-surface layer of low velocity, largely nonindurated sediments and volcanic rocks, (2) an underlying, continuous layer of densely welded Bishop Tuff, and (3) precaldera granitic and metamorphic basement rocks below depths of 2.5 to 3.0 km. Regional heat-flow, seismic-refraction, and teleseismic analyses, and the recent occurrence of extrusive volcanism suggest that magma or partially molten rock exists under the western three-fifths of the caldera at depths of 6 to 8 km. The present-day hydrothermal system is dominated by hot water with aquifer temperatures at depth, estimated from the geochemistry of hot-spring waters, of about 210 to 280 degrees C. (Woodard-USGS)
W79-03343

SUMMARY APPRAISALS OF THE NATION'S GROUND-WATER RESOURCE--MID-ATLANTIC REGION,
Geological Survey, Reston, VA. Water Resources Div.
A. Sinnott, and E. M. Cushing.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $1.60. Professional Paper 813-I, 1978. 32 p, 10 fig, 2 tab, 105 ref.

Descriptors: *Groundwater resources, *Regional analysis, *Aquifer management, *Water supply, *Groundwater availability, Water quality, Aquifer characteristics, Withdrawal, Water yield, Groundwater recharge, Water storage, Water resources development, Projections, Atlantic Coastal Plain, *Mid-Atlantic Region, Hudson River basin, Susquehanna River basin, Potomac River basin, Delaware River basin, James River basin.

The Mid-Atlantic Region covers a total area of about 108,000 square miles. It includes parts of Vermont, Massachusetts, New York, Pennsylvania, Maryland, West Virginia, and Virginia, the entire States of New Jersey and Delaware, and the District of Columbia. It encompasses the entire drainage basins (within the United States), the Hudson, Delaware, Susquehanna, Potomac, and the James River and includes Long Island and the coastal drainage of New Jersey, Delaware, Maryland, and Virginia. Ground water is derived primarily from precipitation. The natural discharge from the aquifers in the region is estimated to be at about 38.6 billion gallons per day; in addition, at least 140-350 trillion gallons is stored in the aquifers. About 949 billion gallons of fresh ground water was withdrawn in 1970. This quantity represents about 9 percent of the total freshwater use of 10,220 billion gallons. Available ground-water reserves indicate that a considerable part of the additional supplies needed for the anticipated increase in economic activity in the region could be developed from ground water. (Woodard-USGS)
W79-03344

PREDICTED WATER-LEVEL AND WATER-QUALITY EFFECTS OF ARTIFICIAL RECHARGE IN THE UPPER COACHELLA VALLEY, CALIFORNIA, USING A FINITE-ELEMENT DIGITAL MODEL,
Geological Survey, Menlo Park CA. Water Resources Div.
L. A. Swain.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 551, A04 in printed copy, A01 in microfiche. Water-Resources Investigations 77-29, April 1978. 54 p, 33 fig, 9 tab, 11 ref.

Descriptors: *Artificial recharge, *Water levels, *Water quality, *Groundwater resources, *Forecasting, Groundwater movement, Model studies, Finite element analysis, Aquifer management, Water supply, Water demand, *California, *Coachella Valley(Calif).

From 1936 to 1974, water levels declined more than 100 feet in the Palm Springs area and 60 feet in the Palm Desert area of the upper Coachella Valley, Calif. Water from the Colorado River Aqueduct is presently being recharged to the basin. The dissolved-solids concentration of native ground water in the recharge area is about 210 mg/liter and that of recharge water ranges from 600 to 750 mg/liter. A finite-element model indicates that without recharge the 1974 water levels in the Palm Springs area will decline 200 feet by the year 2000 because of pumpage. If the aquifer is recharged at a rate from about 7,500 acre-feet per year in 1973 increasing to 61,200 acre-feet per year in 1990 and thereafter, the water level in the Palm Springs area will decline about 20 feet below the 1974 level by 1991 and recover to the 1974 level by 2000. The solute-transport finite-element model of the recharge area indicates that the artificial recharge plume (bounded by the 300-mg/liter line)

move about 1.1 miles downgradient of the harge ponds by 1981 and about 4.5 miles from ponds by 2000. (Woodard-USGS)

LL-RESPONSE MODEL OF THE CON-NED AREA, BUNKER HILL GROUND-TER BASIN, SAN BERNARDINO COUNTY, LIFORNIA,
ological Survey, Menlo Park, CA. Water Re-rces Div.
. Durbin, and C. O. Morgan.
ailable from the National Technical Information vice, Springfield, VA 22161 as PB-288 515, A03 printed copy, A01 in microfiche. Water-Re-rces Investigations 77-129, July 1978. 39 p, 20 8 tab, 15 ref.

scriptors: *Groundwater recharge, *Natural re-rge, *Artificial recharge, *Model studies, *Po-tiometric level, Forecasting, Confined water, uifer management, Mathematical models, Com-er models, Analytical techniques, *California, nker Hill ground-water basin(Calif), San Ber-dino County, Well-response model.

e Bunker Hill ground-water basin, in the vicini-of San Bernardino, Calif., is being artificially harged with imported water. Current and ure artificial recharge of the basin may cause the entiometric surface in an area of confined und water to rise above land surface and water flow from uncapped and unplugged wells. This uld cause damage to structures where the soil comes waterlogged and where buried wells gin to flow beneath the structures. A well-re-onse model was used to generate a series of ter-level hydrographs representing the response the ground-water basin to six possible combina-ns of conditions for each well; one pumping e, two artificial-recharge rate, and three natural-harge rates. Inflow to the ground-water basin ceeds outflow for all tested combinations. Ac-rding to model predictions, the accumulation of red ground water resulting from the excess of low is sufficient to cause the water level in the ected wells to rise above land surface for all but e of the combinations of conditions tested. ater levels in wells are predicted to rise above land surface as early as 1981 for the combina-n with the greatest excess of inflow. 4C. Effects On Water Of Man's Non-Water Activities

EVALUATION OF URBANIZATION AND CHANGES IN LAND USE ON THE WATER RESOURCES OF MOUNTAIN VALLEYS,
Idaho Univ., Moscow. Dept. of Civil Engineering.
C. E. Brockway, and K. P. Grover.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 735, Price codes: A07 in paper copy, A01 in microfiche. Idaho Water Resources Research Institute, University of Idaho Research Technical Completion Report, October 1978. 113 p, 42 fig, 7 tab, 10 ref, append. OWRT B-038-IDA(1), 14-34-0001-6701.

Descriptors: *Groundwater models, Aquifers, *Silver Creek-Big Woods(Ida), Model studies, *Idaho, *Land use, *Urbanization, Evaluation, Streams.

Impact of projected changes in land use on aquifer and stream systems of the Big Wood River-Silver Creek area, S. Idaho was evaluated using, finite difference model of the groundwater system. Water table and confined aquifers were simulated. Simulated groundwater levels and spring flows were determined for projected changes in land use. Severe decreases up to 38% in discharge of Silver Creek, a productive spring fed trout stream were projected. Groundwater levels in water table and artesian aquifers could decline up to 16 feet. Most severe impacts will result from conversion of present flood end furrow irrigated land to sprinkler irrigation with attendant decrease in aquifer recharge. 1977 drought, during which irrigation diversions were 28% of 1975 diversions, was simulated and compared with measured data. Reasonable comparisons of simulated and measured groundwater levels and spring flows support the validity of the model as a planning tool.

UTILITY LINE SITING AND WETLAND PRESERVATION,
Wisconsin Univ. Madison. Land Resources.
E. Quigley.
PhD Disseration, May 1977. 210 p, 29 fig, 19 tab, 293 ref, 7 append.

Descriptors: *Wetlands, *Electrical networks, Utilities, Transmission lines, Transmission towers, Aesthetics, Vegetation effects.

Over 70% of the utility lines passing through wetlands parallel other linear land uses in wetlands, primarily roads or railroads; however, only 30% of the lines were immediately adjacent to the road or railroad, resulting in parallel corridors of impact. The most obvious impacts from the lines are that shrubs and trees are cut, and that transmission towers and lines are visable. At some sites, utility lines have significant impact on wetland hydrology and vegetation. Other potential significant impacts include impacts on waterfowl, and microclimatic and radiation impacts. Although the United Arab Emirates are world leaders in per capita gross national product, ecological information relevant to the area's natural habitat and the environmental effects of its industrial revolution are scarce or non-existent. This paper attempts to gather together information known concerning its climate, physiography, soils, water, agriculture, indigenous vegetation, terrestrial and marine fauna (including lists of species present), and settlement patterns. Since few crops other than dates can be grown without irrigation, several hundred bore holes have been drilled and sea water desalination plants constructed mainly for the benefit of coastal towns. Salinity problems have plagued many irrigation projects, attributable to salt water intrusion from the Gulf, highly mineralized groundwater, and over use of irrigation water, although here, as with other data, incomplete information precludes absolutes. From this extensive review of what is known about the area, this author cites the following as areas in which ecological research is needed: (1) destructive effects of desert settlement, (2) overstocking as a result of increased fodder production, (3) increased populations of wildlife reservoirs of vector-borne diseases as a result of irrigation and afforestation, (4) depletion of wildlife resources, particularly that caused by coastal development, and (5) effects of marine and atmospheric pollution by coastal industry. HARVESTING EFFECTS ON SOIL AND WATER IN THE EASTERN HARDWOOD FOREST,
Northeastern Forest Experiment Station, Parsons,

WV. Timber and Watershed Lab.
J. H. Patric.
Southern Journal of Applied Forestry, Vol. 2, No. 3, p. 66-73, August 1978. 7 illus.

Descriptors: *Lumbering, *Forest watersheds, *Forest soils, *Soil erosion, *Water quality, Hardwood, United States, Roads, Road design, Forest fires, Evaporation, Flooding, Nutrients, Fertilizers, Water pollution sources, Water pollution, Water temperature, Water pollution effects.

Soil erosion is a normal geologic process that is accelerated modestly and briefly by logging, even with careful practices. Overland flow seldom occurs in the carefully managed forest; its occurrence on logging roads is a common, though preventable, cause of accelerated erosion. It has not been shown that conventional logging practices decrease soil productivity. Careless logging and road building, especially near stream channels, can accelerate soil erosion substantially. Fire may modestly and briefly accelerate soil erosion. Tree cutting reduces evaporative losses with corresponding gains in stream volume. Logging in scattered blocks has negligible effects on river flooding. Logging temporarily accelerates the release of nutrients from the forest floor, causing some enrichment of streams. Fertilization also enriches streams temporarily. Channel clearing increases water temperature until regrowth restores shading. (Witt-IPC)

HYDROLOGIC IMPACT OF GRAZING ON INFILTRATION: A CRITICAL REVIEW,
Utah State Univ., Logan. Watershed Science Unit.
G. F. Gifford, and R. H. Hawkins.
Water Resources Research, Vol. 14, No. 2, p. 305-313, April, 1978. 5 fig, 4 tab, 37 ref.

Descriptors: *Grazing, *Infiltration, *Infiltration rates, Hydrologic aspects, *Reviews, Ranges, Runoff, Hydrographs, Water yield, Range management.

The hydrologic importance of grazing is receiving increased attention on rangelands in the United States. The literature on this topic is fragmented. This paper explores the available literature for information useful in understanding the hydrologic impacts of grazing intensity as related primarily to infiltration and runoff. Generally, data relative to range condition are not adequate for evaluating hydrologic impacts. Data relating grazing intensity to infiltration rates are available, yet distinct limitations are evident. These limitations are discussed in terms of identifying future research needs. The greatest need appears to be a detailed definition of the long-term effects of grazing (by year and season) on infiltration rates as a function of site, range condition, and grazing intensity. Once obtained, infiltration rates must be coupled with an appropriate method for generating runoff volumes, storm hydrographs, and long-term water yields. (Skogerboe-Colorado State)

THE SANDS OF WRATH: AMERICA'S DUST BOWL IN RETROSPECT,
Texas Tech Univ., Lubbock.
H. E. Dregne.
UNESCO Courier, July 1977, p 14-17. 3 fig.

Descriptors: *Desertification, *History, *Salinity, *Drainage, *Grazing, *Erosion, Saturated soils, Land use, Irrigation practices, Ecosystems, Arid lands, Water management(Applied).

Three instances of widespread desertification in the U.S. are reviewed to identify and illustrate the nature of arid ecosystems and their low resilience after disturbance. The most recent of these catastrophic events occurred in the semiarid southern Great Plains, an area which came to be known as the dust bowl. A long period of improper management stemming from a lack of understanding or experience in arid regions created land erosion so great that a dust pall spread over the humid eastern U.S. and over the Atlantic. The second case of widespread desertification reviewed here began with the rapid settlement of the arid west in the second half of the 19th century. Increasing numbers of grazing cattle and sheep turned grasslands into arid rangeland by the beginning of the 20th century. Natural reestablishment of a grass cover is difficult under such circumstances, although a general awareness of the problem since 1910 has precipitated productive research on range management that is just now showing benefits. The third instance of desertification discussed here is associated with the rapid expansion of irrigation in the west since the end of the 19th century that has produced waterlogging and salinization problems. Poorly drained soils were heavily irrigated because they occupied low-lying level areas easy to irrigate. Lack of prior knowledge or experience with salination or waterlogging hazards created large tracks of unproductive land difficult to reclaim This author presents this analysis to illustrate how signs of desertification can be recognized and corrective measures taken before massive destruction takes its toll again. SOIL EROSION CONTROL ON CONSTRUCTION SITES WITH PORTLAND CEMENT,
Science and Education Administration, Oxford, MS. Sedimentation Lab.
M. J. M. Romkens, C. B. Johnson, and D. W. Nelson.
Journal of Soil and Water Conservation, Vol 33, No 5, p 232-235, September 1978. 2 fig, 2 tab, 9 ref.

Descriptors: *Portland cements, *Erosion, *Construction, Soils, Erosion control, Erosion rates, Cements, Soil erosion, Vegetation, Rainfall simulators, Vegetable-cover, Chemical stabilizers.

Simulated rainfall was used to determine the erosion control effects of portland cement on upland soils. Treatments included 4 rates of cement application and 2 methods of cement incorporation on 2 medium-textured soils. The application of 2.50 metric tons of portland cement per hectare (1.1 tons/acre), applied as a suspension on a tilled slope of moderate steepness and length, nearly eliminated soil erosion. Lower rates of cement application proved ineffective in controlling soil erosion while higher application rates resulted in adverse effec on the establishment of vegetative cover. Incorpo ration of cement into the top 2.5 cm (1 inch) of so at the 2.50-metric-ton-per-hectare rate proved ine fective for soil erosion control. (Lee-ISWS)

Trade-offs between erosion control and productio costs were estimated for the nation and 105 pr ducing regions. This analysis employed a linea programming model in which values were place both on soil loss and production costs. The trad off curve derived showed that, nationally, annu soil loss can be reduced from an average of 5.56 2.50 tons per acre with only slight increases production costs. A further reducton to 1.98 to per acre, however, entails much greater cost i creases. Land values and commodity prices follo similar patterns. (Sims-ISWS)

Wet-precipitation-only samplers were used to collect acid rainfall in Pasadena, California, from February 1976 to September 1977. The concentrations of the major cations (H(+), NH4(+), K(+), Ca(2+), and Mg(2+)) and the major anions (Cl(-), NO3(-), SO4(2-)) were determined. The relative importance of different sources was calculated by a chemical balance. The volume weighted mean pH was 4.06, with nitric acid being 32% more important than sulfuric acid. The pH was controlled by the interaction of bases and strong acids. (Sims-ISWS)

A COMPARISON OF DISCRETE AND INTENSIVE SAMPLING FOR MEASURING THE LOADS OF NITROGEN AND PHOSPHORUS IN THE RIVER MAIN, COUNTY ANTRIM,
Northern Ireland Dept. of Agriculture, Antrim. Freshwater Biological Investigation Unit.
R. J. Stevens, and R. V. Smith.
Water Research, Vol 12, No 10, p 823-830, 1978. 4 fig, 9 tab, 26 ref.

Descriptors: *Sampling, *Phosphorus, *Nitrogen, *River flow, Nutrients, Water quality, On-site data collections, Rivers, Pollutants, *Pollutant identification, Chemical analysis, Data processing, Statistical models, Water sampling, Water pollution, Fertilizers, *River Main(Northern Ireland), Sampling frequency.

The River Main, County Antrim, was intensively monitored during November 1974 to May 1975 to obtain accurate measurements of the loads of nitrogen and phosphorus to compare with loads predicted by a statistical model from discrete sampling and continuous flow data. During the survey period, 2-hourly samples were collected on 102 days. Flow data were available from continuous recording of river level. Depending on the prevailing flow conditions, 2-hourly or composite 8-hourly samples were analyzed for soluble reactive P, soluble unreactive P, total soluble P, particulate P, total P, nitrate N, Kjeldahl N, and total N. For the discrete sampling program, grab samples were collected at 8-day intervals and analyzed for soluble reactive P, total P, and nitrate N. River flow data showed the 'flashy' nature of the discharge and flow variation by two orders of magnitude. During intensive monitoring, particulate P concentration varied by two orders of magnitude, while all other fractions varied by about one order of magnitude. Therefore, flow was more important in determining loads for all fractions except particulate P. The concentration of all fractions, except soluble unreactive P, were related significantly to flow. Loads and flows generally were related best by log load-log flow equations. The slopes of these equations indicated that soluble reactive P and nitrate N sources were diluted by low concentration water at high flows, whereas particulate P sources increased at high flows due to erosion and surface run-off. (Sims-ISWS)

ARSENIC STABILITY IN CONTAMINATED SOILS,

Missouri Univ.-Columbia. Dept. of Agronomy.
R. E. Hess, and R. W. Blanchar.
Soil Science Society of America Journal Vol 40, No. 6, p 847-852 November-December 1976 1 fig, 3 tab, 19 ref.

Descriptors: *Arsenates, Sampling, Soil analysis, Aluminum arsenate, Iron arsenate, Calcium arsenate, Manganese arsenate, Lead arsenate, Manganese oxides, *Pollutant identification, *Missouri, *Arsenic compounds.

Various Al, Ca, Fe, Mn, and Pb arsenate compounds were formed and their solubility products determined. The amount of arsenate in solution for each of the compounds could be predicted as follows: AlAsO4 . 2H2O(pAsO4 = 24.51-3pH), FeAsO4 . 2H2O or Fe(OH)3 . FeAsO4(pAsO4=26.07-3pH), Ca3(AsO4)2 . 14H2O(pAsO4=9.29-1.5pCa), Pb3(Aso4)2 . 4H2O(pAsO4 = 19.75-1.5pPb), and Mn3(AsO4)2 (pAsO4 = 35.6-12.8Eh-2.3pH), or (pAsO4 = 47.3-25.3Eh-3pH), with either Mn2O3 or MnO2. Samples from Sharpsburg and Menfro soils were equilbrated for 7 days at 25 degree C with dilute HCl and NaOH. Aluminum, Fe, Ca, Mn, Pb, and As contents pH and E (platinum) were determined on the solution portions. The values of pA1 + 3pOH, pA1 + pAsO4, pFe + 3pOH, pFE + pAsO4, 3pCA + 2pAsO4, 3pMn + 2pAsO4, and 3pPb + 2pAsO4 were computed for each soil. The values of the ion products indicated that equilibrum solutions from both soils were undersaturated with respect to A1, Fe, ad Ca and that Pb and Mn arsenate were stable in the Menfro and Sharpsburg soils.

DONNAN DIALYSIS MATRIX NORMALIZATION FOR CATHODIC STRIPPING VOLTAMMETRY,
Southern Illinois Univ., Carbondale. Dept. of Chemistry and Biochemistry.
J. A. Cox, and K. H. Cheng.
Analytical Letters. Vol. A11, No 8, p 653-660, 1978. 1 tab, 7 ref. OWRT-A-087-ILL(4).

Descriptors: *Ion exchange membranes/phosphates, *Dialysis, Arsenate/stripping analysis, Volumetric analysis, *Analytical techniques, *Pollutant identification.

Previously reported cathodic stripping methods for the determination of phosphate and arsenate which were based upon reversible oxidation of Fe(II) to sparingly soluble salts at an inert electrode were subject to several interferences and were influenced by the sample matrix. In the present study Donnan dialysis was used to transfer the test ions from the sample into a controlled electrolyte. Subsequently, stripping analysis was performed. The resulting determinations were independent of the matrix of the original sample over a wide variety of conditions. Using lake water and wastewater samples, results were obtained which were statistically equivalent to widely accepted analytical procedures for trace level determinations.

S. C. Travis.
Publication No. 10795-103-50-8-78-CR 1978. 93 p, 5 fig, 9 tab, 50 ref, 1 append.

Descriptors: *Benthic fauna, *Bioindicators, *Water pollution effects, *Ecological distribution, On-site data collections, Statistical methods, Niches, Massachusetts, Freshwater, Water quality, Monitoring, Aquatic habitats, Data collections, Discriminant analysis.

Using the concept of niche as an N-dimensional hypervolume, 12 variables were employed to illustrate the physical, chemical and microbiological parameters which provide separation between 25 genera of freshwater benthic macroinvertebrates. The study was based on data collected from 120 sites in the state of Massachusetts by the Massachusetts Division of Water Pollution Control during 1974 and 1975. The range of values under which each genus was collected is reported along with the genus mean for each variable. In a special analysis of organic pollution, a discriminant analysis was performed on dissolved oxygen, biochemical oxygen demand, ammonia and total coliform data. A single discriminant function was sufficient to account for 74.4% of the variation exhibited within the data. This function was used as an index of organic contamination for each station at which one of the 25 genera were collected. The preference exhibited by each genus for organic pollution was taken as its mean value (discriminant score). The analysis demonstrated several statistically significant differences between environmental preferences at the genus level. In particular, levels of organic contamination proved to be operationally significant in providing niche separation. Depth, velocity and substrate preferences also provided some niche separation and were correlated with eutrophic preference, the most pollution-sensitive general being associated with shallow depth, high velocities and complex substrates. However, the more pollution-tolerant types exhibited the broadest habitat distributions.

AN IMPROVED HYDRAZINE REDUCTION METHOD FOR THE AUTOMATED DETERMINATION OF LOW NITRATE LEVELS IN FRESHWATER,
Department of Scientific and Industrial Research Taupo (New Zealand). Freshwater Section.
M. T. Downes.
Water Research, Vol. 12, No. 9, 1978, p 673-675. 4 fig, 6 ref.

Descriptors: *Pollutant identification, Freshwater, *Hydrazine reduction, *Methodology, *Nitrates, *Measurement, *Analytical techniques, Lakes, New Zealand, Nutrients, Nitrites, Hydrazine sulfate, Alkalinity, Copper, Zinc, Ions.

An automated method was developed for determining low nitrate levels (which rarely exceed 30 mg/cu m and often are less than 2 mg N/cu m) encountered in three lakes on New Zealand's North Island, in which nitrate is reduced to nitrite with hydrazine sulfate under alkaline conditions in the presence of copper (2+) and zinc (2+). Interferences present in natural water samples are eliminated by addition of zinc (2+) and the copper (2+) catalyst solution. The method compares favorably with the manual copperized cadmium technique for freshwater samples containing 10-800 mg/cu m nitrate-nitrogen. The method is also linear at nitrate concentrations below 10 mg N/cu m, whereas the automated copperized cadmium reduction technique does not have the required sensitivity or precision at low concentrations. With the new method the standard deviation of blanks and of samples containing two mg nitrate-nitrogen/cu m was 0.013 and 0.06 mg N/cu m, respectively, at an analysis rate of 30 samples/hr. The method modifies earlier techniques of Kamphake, et al., and of Mullin and Riley. Deionized distilled water was used throughout. The catalyst solution consisted of 0.0354 g A.R. CuSO4-5H20 plus 0.9 ZnSO4-7H2O in one liter water. Other reagents were 40 g/l sodium hydroxide solution, 1.71 g/l hydrazine sulfate solution, 10 g sulfanilamide solution in one liter 10% A.R. hydrochloric acid, and one g/l N-1-naphthylethylenediamine dihydrochloride. (Lynch-Wisconsin)

SOME FACTORS AFFECTING ON DRY WEIGHT, ORGANIC WEIGHT AND CONCENTRATIONS OF CARBON AND NITROGEN IN FRESHLY PREPARED AND IN PRESERVED ZOOPLANKTON,
Scripps Institution of Oceanography, La Jolla, CA.
M. Omori.
Internationale Revue der Gesamten Hydrobiologie, Vol. 63, No. 2, 1978, p 261-269. 2 fig, 4 tab, ref.

Descriptors: *Zooplankton, Methodology, *Rinsing, *Drying, *Preservation, Weight, *Dry weight, *Organic weight, *Organic matter, *Carbon, *Nitrogen, Calanus sinicus, Pleuromamma xiphias, Acartia tonsa, Sagitta nagae, Copepods, Chaetognatha, Formaldehyde, Ammonium formate, Seawater, Freeze drying, Oven drying.

Effects of three rinses and four preservation techniques on dry weight, organic weight, total carbon, and total nitrogen of zooplankton specimens were evaluated. Rinses were: (1) distilled water, (2) seawater, and (3) ammonium formate. Preservation techniques were: (1) freeze-drying, (2) oven-drying, (3) borax-buffered formaldehyde-seawater solution, and (4) hexamine-buffered formaldehyde solution. Zooplankton tested were the chaetognath Sagitta nagae, and the copepods Calanus sinicus, Pleuromamma xiphias, and Acartia tonsa. Samples rinsed with distilled water were always lighter than samples rinsed with seawater with apparent weight decreases in organic matter and total carbon and nitrogen; losses increased with increasing volume of rinse water. Use of such a hypotonic substance for even a short period may cause osmotic damage to cells and loss of intracellular material; distilled water volume should not exceed 0.3 ml/1 mg dry wt of sample. Isotonic ammonium formate rinse often results in the widest range of variation; on the average organic weight and chemical contents were slightly lower than with filtered seawater. Freeze-drying raised dry and organic weights and chemical composition somewhat higher than for oven-dried samples. The borax-buffered formaldehyde-seawater solution significantly decreased the weight of organic matter and chemical contents within 2.5 days, and after one week loss of organic weight exceeded 20%. Hexamine-buffered formaldehyde produced somewhat different results. (Lynch-Wisconsin)

ORGANIC CARBON-A NONSPECIFIC WATER QUALITY INDICATOR FOR LAKE SUPERIOR,
Minnesota Univ., Minneapolis. Dept. of Civil Mineral Engineering.
W. J. Maier, and W. R. Swain.
Water Research, Vol. 12, No. 8, p 523-529, 2 fig, 3 tab, 22 ref.

Descriptors: *Lake Superior, *Organic carbon, *Water quality indices, *Indicators, *Indicators, *Inorganic carbon, Biochemical oxygen demand, Organic matter, Carbon, Great Lakes, Lakes, Water quality, Combustion, Infrared radiation, Temporal distribution, Spatial distribution, Water pollution effects, Baseline studies, Oligotrophy, Methodology, Analytical techniques.

High total organic carbon (TOC) concentrations in Lake Superior correlated with low water quality (determined by criteria of the International Joint Commission for the Great Lakes), and a scheme relating TOC to water quality for the lake was formulated. Measurement of organic carbon by combustion and infrared absorption is a promising technique for monitoring high quality water, such as found in Lake Superior; BOD is not sufficiently sensitive for characterizing relatively unpolluted waters, and measures only the biodegradable fraction of organics. TOC is a nonspecific test that determines the presence of reduced carbon,

does not differentiate between biodegradable and biochemically refractory materials. Baseline concentrations of organic and inorganic carbon in Lake Superior were established on the basis of samples collected at 21 stations around the lake's perimeter and that of Isle Royale. Temporal and spatial distribution of organic carbon in open waters and in the vicinity of pollution inflows is described. Unpolluted open water averages 1.1 mg/l TOC, and 8-10 mg/l total inorganic carbon (TIC). TOC levels at the surface and at a depth of five ft are indistinguishable. In the vicinity of point pollution sources TOC range 15 3-101 mg/l, the higher value indicating gross pollution. Shoreline or land mass effects were detected in all nearshore samples, where TOC and TIC values were somewhat higher than in open waters. In the Duluth-Superior harbor area TOC was an averaged 12.6 mg/l higher than open water, and TIC 17.1 mg/l higher. (Lynch-Wisconsin)

CHEMICAL ANALYSIS OF INTERSTATE CARRIER WATER SUPPLY SYSTEMS,
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 600, Price codes: A06 in paper copy, A01 in microfiche. Report No. EPA-430/9-75-005, April 1975. 98 p, 2 tab.

Descriptors: *Water supply, *Water quality standards, *Chemical analysis, *Water data, Statistics, Data collections, Water analysis, Alkalinity, Sodium, Mercury, Iron, Manganese, Dissolved solids, Hardness, Public health, Drinking water.

Tabulated data reporting the chemical analysis of water supply systems serving interstate carriers is reported. Data has been furnished by the state agencies or are from analyses performed by Environmental Protection Agency laboratories. Chemical and related water quality criteria and the effects of the constituents in drinking water are summarized in Table I. The extent of non-compliance with the Drinking Water Standards (DWS) is summarized in Table II; only the number of supplies failing the mandatory limit is indicated when both mandatory and recommended limits are listed for a single constituent. The most common constituents which failed the DWS limits were: iron, manganese, and total dissolved solids. The current DWS does not contain limits for sodium, alkalinity, hardness, pH, or mercury. Mercury limits have been proposed, and concentrations of mercury failing to meet the proposed limit are indicated. Table II is arranged according to EPA regions and the states therein. (Davison-IPA)

DEVELOPMENT OF AN ON-LINE ORGANIC ANALYZER FOR THE MUST WATER PROCESSING ELEMENT,
Abcor, Inc., Wilmington, MA. Walden Div.
K. J. McNulty, R. L. Goldsmith, J. F. McCoy, and A. Zakak.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A025 116, Price Codes: A03 in paper copy, A01 in microfiche. Final Report, May 1976. 14 p, 6 fig, 2 ref. DAMD 17-75-C-5051.

Descriptors: *Waste water treatment, *Instrumentation, *Organic wastes, Water pollution sources, Carbon, Oxidation, Water pollution treatment, Toxicity, Analyzers, Separation techniques, Organic compounds, Water quality, Waste treatment.

MUST waste treatment systems require an on-line organics monitor to control and monitor the level of organics in the treated effluent. As a first step in the development of such a system, a breadboard total organic carbon (TOC) monitor was designed, built, debugged and tested. The following sequential unit processes were involved in this system: inorganic carbon removal, catalytic oxidation of organic carbon to carbon dioxide, condensation and removal of water vapor, catalytic reduction of carbon dioxide to carbon tetrafluoride, and quantitative analysis for carbon tetrafluoride by flame ionization. Various standard solutions of potassium hydrogen phthalate were used to test the breadboard system; a Dohrmann DC-50 organic analyzer was used to determine the 'true' TOC's of the standard solutions. The breadboard system was in agreement with the commercial analyzer over the entire range of TOC's tested. Its estimated accuracy and linearity are + 1.75 mg/l. It is concluded that this concept using a continuous sample flow is comparable to commercially available TOC analyzers. (Davison-IPA)

A HYDROLOGIC STUDY OF WATER WELL YIELDS AND GROUNDWATER QUALITY RELATED TO STRATIGRAPHIC AND STRUCTURAL SETTINGS IN WESTERN JACKSON COUNTY, WEST VIRGINIA,
West Virginia Univ., Morgantown. Dept. of Geology and Geography.
D. S. Jones, and H. W. Rauch.
January 1978. 24 p, 2 fig, 2 tab, 2 plate, 10 ref, 2 append.

Descriptors: *Groundwater resources, *On-site investigations, *West Virginia, *Ohio River, *Appalachian Mountain Region, Water wells, Water yield, Water quality, Alluvial aquifers, Bedrock, Nitrates, Fractures(Geologic), Aerial photography, Statistical methods, Lineaments.

Chemical and physical parameters for 86 wells and one spring were determined for a portion of western Jackson County, West Virginia. Many of the wells are fairly deep (median depth=165 feet), with the median depth to water being 50 feet. Well yields are relatively low (median yield=2.5 gpm). Valley wells, especially those with in 250 feet of a stream, have higher yields than hilltop or hillside wells. The primary rock aquifer units supplying water to 93% of the area's wells are lower Dunkard to middle-Monongahela in age. The best locations for tapping alluvial aquifers would be on a flood plain or terrace of the Ohio River, where yields of at least 10 gpm can be expected. Wells located within 100 feet of mapped photo-lineaments yield water at significantly greater rates than more distant wells. In general, groundwater quality is considered good. Groundwater in the Sandyville and Ripley quadrangles is usually quite soft. Groundwater in the Kenna quadrangle generally contains low total dissolved solids but often has excessive concentrations of iron. High sodium and chloride concentrations are common south of Cottageville, and a few scattered wells showed evidence of nitrate pollution. (Visocky-ISWS)

APPLICATION OF THE ROTATED DISK ELECTRODE TO MEASUREMENT OF COPPER COMPLEX DISSOCIATION RATE CONSTANTS IN MARINE COASTAL SAMPLES,

North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
M. S. Shuman, and L. C. Michael.
Environmental Science and Technology, Vol. 12, No. 9, p. 1069-1072, September 1978. 7 fig, 18 ref.

Descriptors: *Pollutant identification, *Copper, *Chelation, Metals, Measurement, Water pollution, *Outer Continental Shelf, U.S. Mid-Atlantic coast.

A rotating disk electrode technique was used to estimate dissociation rate constants of copper chelates formed in marine coastal samples, to measure the extend of Cu chelation in these samples, and to establish an operational definition for labile and nonlabile metal complexes based on a kinetic criterion. Samples collected off the mid-Atlantic coast showed various degrees of chelation toward copper. A first order dissociation rate constant for copper chelates was estimated to be of the order of 2 s to the (-1) power. (Sinha-OEIS)

POSSIBLE ERRORS CAUSED PRIOR TO MEASUREMENT OF MERCURY IN NATURAL WATERS WITH SPECIAL REFERENCE TO SEAWATER,
Hokkaido Univ., Hakodate (Japan). Dept. of Chemistry.
K. Matsunaga, S. Konishi, and M. Nishimura.
Environmental Science & Technology, Vol. 13, No. 1, p. 63-65, January 1979. 2 fig, 4 tab, 17 ref.

Descriptors: *Mercury, *Measurement, *Water pollution, *Laboratory tests, Sea water, Pollutant identification, Metals, Outer Continental Shelf.

Taking seawater as an example, analytical problems in the mercury determination of natural waters are presented, with a special reference to errors caused prior to measurement of mercury. A mercury concentration of 0.5 ppb decreases rapidly even in an acidified solution, but the presence of sodium chloride prevents the adsorption loss onto the bottle wall. Therefore, if a seawater sample is acidified to 0.2 M with sulfuric acid at sampling, the mercury is stable for at least 60 days. Polyethylene bottles are unreliable because of mercury contamination. Glass bottles contaminated with mercury can be cleaned by heating at 500 deg C or rinsing with diluted hydrofluoric acid. Then there is no contamination and no mercury loss, the apparent mercury concentration an acidified seawater sample increases for a couple of weeks due to a change in form of the mercury species in seawater, and then reaches a constant value which is consistent with the value determined after digestion with a mixture of nitric acid and sulfuric acid, or a mixture of nitric acid and sulfuric acid, or a mixture of nitric acid, potassium permanganate, and persulfate. The level of 5-6 ng of Hg/L determined with the considerations described above seems to be the base-line concentration of mercury in the oceans. (Sinha-OEIS)

MEASUREMENT OF CU AND ZN IN SAN DIEGO BAY BY AUTOMATED ANODIC STRIPPING VOLTAMMETRY,
Naval Ocean Systems Center, San Diego, CA.
A. Zirino, S. H. Lieberman, and C. Claveli.
Environmental Science and Technology, Vol 12, No 1, p 73-79, January 1979. 12 fig, 13 ref.

Descriptors: *Metals, Copper, *Zinc, *Measurement, *Water pollution, Environmental effects, Resources development, Tides, *California, Outer Continental Shelf, *San Diego Bay(CA).

Cu and Zn values were measured in San Diego Bay by annodic stripping voltammetry with a specially built, automated instrument. During 1975-1977, trace metal surveys were conducted in the bay from a small vessel. Samples were collected and analyzed aboard the craft while underway. Cu and Zn concentrations were less than 0.1 and 0.6 micro g/L, respectively, at the mouth of the bay and increased toward the center of the bay to approximately 2.5 and 2.9 micro g/L, respectively. Also, synoptic measurements made at a stationary pier location showed that Cu and Zn concentrations coincided precisely but inversely with tidal cycles. Cu and Zn measurements made by automated anodic stripping voltammetry were compared to measurements made by extraction of Chelex 100 followed by analysis by flame atomization atomic absorption spectrophotometry. The two methods produced values that were indistinguishable within experimental error. (Sinha-OEIS)

POLLUTION CONTROL REGULATIONS AND MONITORING TECHNOLOGY: A REVIEW OF RESEARCH AND DEVELOPMENT FROM THE PULP AND PAPER INDUSTRY,
Victoria Univ. (British Columbia). Dept. of Biology.
D. V. Ellis.
Progress in Water Technology, Vol. 9, p. 673-682, 1977. 17 ref, 1 tab.

Descriptors: *Pulp and paper industry, *Water pollution, *Canada, *Monitoring, *Water quality standards, Foreign countries, Hydrogen ion concentration, Turbidity, Dissolved oxygen, Suspended solids, Toxicity, Water quality, Taste, Odor, Testing procedures, Effluent, Waste dilution, Dispersion, Pulp wastes, Water pollution sources, Instrumentation, British Columbia(Canada).

An environmental monitoring program to meet the requirements of water pollution control in force in British Columbia (Canada) is suggested for the pulp and paper industry. Step I is the monitoring of the numerically restrained receiving water parameter, viz., dissolved oxygen, pH, turbidity, settleable and suspended solids, and toxicity. Step II is the determination of the effluent's zone of influence using water quality parameter. Simple visual, smell, and taste characteristics should not be overlooked. Instrumental tests should include at least those on the numerically restrained parameter, but extended to a 3-dimensional sampling pattern to show dilution and dispersion of the effluent in addition to compliance with the regulations. Biological tests encompassing various levels in and routes through the local food chain are carried out in step III. (Swichtenberg-IPC)

NEW ONLINE SENSOR CHECKS SAVEALL EFFLUENT FOR ITS FIBER CONTENT,
Consolidated Papers, Inc., Wisconsin Rapids, WI.
F. A. Gilbert, Jr., and P. J. Clack.
Pulp and Paper, Vol. 52, No. 9, p. 94-96, August, 1978. 4 fig, 1 tab.

Descriptors: *Pulp wastes, *Fibers(Plant), *Instrumentation, *Water analysis, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Effluents, Turbidity, Filtration, Suspended solids, Savealls, White water(Paper machines), Calcium carbonate, Titanium dioxide, Starch, Clays, Industrial water.

Preliminary investigations by the Wisconsin Rapids Division of Consolidated Papers, Inc showed that turbidity and filtration resistance measurements were not suitable indicators of the solids content of paper mill saveall effluents. The Leeds and Northrup Microtrac suspended solids monitor was more responsive to fiber changes than to filler changes (viz., calcium carbonate, clay, starch, and titanium dioxide) in the saveall effluent. This sensitivity is favorable, since a change in the fiber content of the clarified white water from the savealls is more likely to cause paper machine shower plugging. (Swichtenberg-IPC)

SYSTEM FOR ANALYSIS OF ORGANIC POLLUTANTS IN WATER,
La Trobe Univ., Bundoora (Australia). Dept. of Physical Chemistry.
J. D. Morrison, J. F. Smith, and S. F. Stepan.
Technical Paper No. 28, Australian Water Resources Council, Department of National Resources. Australian Government Publishing Service, Canberra, 1977. 53 p, 29 fig, 13 ref, 3 append.

Descriptors: *Water pollution control, *Organic compounds, *Pollutant identification, *Polymer adsorption method, *Extraction, Computer systems, Gas chromatography, Volatility.

Experience gained in the analysis of organic pollutants in water has resulted in a selection of recommended methods for the detailed analysis of volatile organic compounds in water. A polymer adsorption method removed more than 90% of most organic compounds found as pollutants in water. The extraction method was successfully applied in the laboratory and in the field. A Kuderna-Danish evaporator was the most effective means of concentration after extraction. Packed columns were effective for gas chromatography of simple mixtures and SCOT columns provided better overall performance for complex mixtures. A small selection of liquid phases was sufficient for most samples. A computerized data system was found to be essential for practical use of GC-MS in analysis of water extracts. The system was shown to be effective in solving problems related to the analysis of drinking water and the pollution or ground water, as well as in the analyses of various effluents discharged by industry. (Bell-Graff--Cornell)

EMISSION OF MICROBIAL AEROSOLS FROM POLLUTED WATERS IN DENSELY POPULATED REGIONS,
Kentucky Water Resources Research Inst., Lexington.
L. S. Cronholm.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 947, Price codes: A04 in paper copy, A01 in microfiche. Research Report No. 117, 1978. 69 p, 8 fig, 12 tab, 36 ref. OWRT A-068-KY(1), 14-34-000107037, 14-34-0001-7038, 14-34-0001-8019.

Descriptors: *Enteric virus, Waste water treatment, *Air pollution effects, Water quality, *Pathogenic bacteria, *Aerosols, *Pollutant identification.

The air surrounding three activated sludge tanks was sampled over a two year period for the emission of bacterial aerosols under a variety of climatic conditions and at varying distances upwind and downwind of the aerated tanks. All plants emitted species of enteric bacteria which are significant as index organisms and as frank pathogens. The emission pattern of these bacteria were influenced by distance from the plant and wind direction. Within the parameters of a plant, defined arbitrarily in this study by sampling sites less than 150 m upwind and less than 900 m downwind, distance from the source was the only reliable predictor of emissions, and no statistical significance was found in the differences between upwind and downwind samples at the same distances from the plant. Multiple regression analysis revealed no consistent influences of any environmental factor or emission rate, but relative humidity, wind speed, air temperature, and ozone levels showed some contribution on the bacterial count, while light intensity appeared to have little influence. The deposition and retention of enteric bacteria on folage plants near aerated basins was used as an alternate sampling method, and it emphasized the potential hazard of these aerosols. This method confirmed the inability to predict the emission rate by climatic factors, but wind speed contributed directly to the counts, and there was a pronounced difference in the average counts of upwind and downwind samples. (Huffsey-Kentucky)

TEST ORGANISMS AND METHODS USEFUL FOR EARLY ASSESSMENT OF ACUTE TOXICITY OF CHEMICALS,
Dow Chemical, Midland, MI. Health and Environmental Research.
E. E. Kenaga.
Environmental Science and Technology, Vol. 12, No. 12, p. 1322-1329, 1978. 8 tab, 25 ref.

Descriptors: *Bioassay, *Chemical properties, *Pesticide toxicity, *Bioindicators, Insecticides, Herbicides, Toxicity, Pesticide residues, Daphnia, Rodents, Rainbow trout, Mallard duck, Shrimp, Analytical techniques, Testing procedures.

Acute toxicity data for 8 organisms commonly used for evaluation of environmental hazards of chemicals were collected and tabulated for 75 insecticides and herbicides. Correlations concerning the usefulness of each species as a selective, sensitive indicator to a wide spectrum of animal organisms were developed in order to provide a basis for selection of toxicity screening tests for use on thousands of industrial chemicals. The objective is to gain a maximum amount of information from a minimum amount of data based on science, and to know the degree of certainty associated with extrapolation of toxicity data from one species to another. On the basis of these correlations, three organisms were found to be the best indicators of acute toxicity to a wide variety of species. These organisms, the rat, one species of fish, and daphnia, are useful for the first round to acute toxicity testing when use and properties of the chemical result in significant environmental exposure. A COMPARISON OF THE VARIABILITY OF ASELLUS COMMUNIS (CRUSTACEA: ISOPODA) AND GAMMARUS PSEUDOLIMNAEUS (CRUSTACEA: AMPHIPODA) AND SUITABILITY FOR JOINT BIOASSAYS,
Minnesota Univ., St. Paul. Dept. of Entomology, Fisheries, and Wildlife.
D. M. Oseid.

Descriptors: *Bioassay, *Variability, Animal populations, *Crustaceans, Population, Laboratory tests, Testing procedures, Aquatic populations, Predation, Water chemistry, Water quality, Reproduction, Growth rates, Analytical techniques, *Asellus.

These tests indicate that as an individual test organism Asellus has several advantages. It has a lower variability, therefore fewer replications would be required to get the same precision. It can be easily cultured in high numbers in the laboratory and possibly the time to complete a generation is shorter, thereby reducing the time required to do full generation tests. However, apart from variability the tests also showed that in terms of the population parameters the two species produced fairly similar populations. Therefore, when tested in the same test chamber where the two species can interact, both species should have an equal chance to develop a population apart from factors such as competition, predator-prey relations, etc. (EIS-Deal)

MERCURY DETERMINATION IN A RIVER OF MOUNT AMIATA,
Siena Univ. (Italy). Chair of Hydrobiology and Fish-Culture.
E. Bacci, C. Leonzio, and A. Renzoni.
Bulletin of Environmental Contamination and Toxicology, Vol 20, p 577-581, 1978. 1 fig, 11 ref.

Descriptors: *Mercury, *Mine wastes, *Mussels, Industrial wastes, Heavy metals, Animal metabolism, Path of pollutants, Mineral industry, Waste water treatment, Water pollution sources, Sediments, Molluscs, Tissue analysis, Depuration, Unio.

Since 1970 there has been a drastic reduction in the mining activity of this region because of the reduced world demand for mercury. The levels of mercury in water and mussels have been monitored during this reduction. The Hg level in the abductor muscle of mussels collected in 1973 was about one order of magnitude higher than the levels found in organisms collected in other rivers of Italy. In the years 1974-1976 the Hg concentration in the abductor muscles of specimens collected from the same station was sharply reduced. Reasons for this decrease and for the high background levels of Hg are discussed. (EIS-Deal)
W79-03487

MERCURY BURDENS IN CRAYFISH FROM THE WISCONSIN RIVER,
Wisconsin Dept. of Natural Resources, Madison. Bureau of Water Quality.
T. B. Sheffy.
Environmental Pollution, Vol 17, p 219-225, 1978. 3 fig, 1 tab, 6 ref.

Descriptors: *Crayfish, *Mercury, *Bioindicators, Heavy metals, Wisconsin, Animal pathology, Animal metabolism, Path of pollutants, Industrial wastes, Chemical wastes, Pulp wastes, Bottom sediments, Rivers, Monitoring, Wisconsin, Tissue analysis, Bioaccumulation, *Bioindicators, *Wisconsin River.

Mercury determinations were made on crayfish sampled at 34 locations along the Wisconsin River. Residue levels of mercury in crayfish abdominal muscle ranged from 0.07 to 0.56 ppm on a wet weight basis. The pattern of mercury accumulation in crayfish showed a striking similarity to that in bottom sediment, fish and mammals along the Wisconsin River. Based on this observation, the crayfish seems an accurate and convenient indicator species of mercury contamination along a river system, since it is easily obtained and provides an estimate of organic mercury accumulation for other species from the same area. THE TECHNICAL VARIABILITY IN BIOTIC INDICES,
University of Wales Inst. of Science and Technology, Cardiff. Dept. of Applied Biology.
P. M. Murphy.
Environmental Pollution, Vol 17, p 227-235, 1978. 5 fig, 1 tab, 18 ref.

Descriptors: *Bioindicators, *Seasonal, *Mathematical studies, *Statistical methods, Biological communities, Analytical techniques, Fluctuations, Sampling, Water quality, Baseline studies, Mathematical models, Methodology, Monitoring, *Biotic indices, Diversity, Chandler biotic score, Shannon-Weiner Index, Margalef Index, Menhinick Index.

The seasonal stability of six biotic indices used in the assessment of water quality was compared using data obtained from the River Wye and the River Cynon, a polluted tributary of the River Raff (South Wales). It was found that indices utilising a qualitative approach, e.g. Chandler Biotic Score and Average Chandler Biotic Score, gave a far more consistent spatial discrimination between sampling stations than indices based on community diversity, e.g. Shannon-Weiner, Margalef and Menhinick. (EIS-Deal)

DADE COUNTY INDUSTRIAL WASTE SOURCES, INVENTORY AND EVALUATION.
National Field Investigations Center-Denver, CO.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 404, Price codes: A03 in paper copy, A01 in microfiche. Report No EPA/33/2-71/003, March 1971. 42 p, 1 fig, 2 tab, 4 ref, 1 append.

Descriptors: *Water pollution sources, *Water quality, *Pollutant identification, *Industrial wastes, *Dade County, Aquifers, Water supply, Sewers, Canals, Miami River, Waste water disposal, Heavy metals, Hazards, Miami, Florida, Data collections.

Results of an industrial waste water inventory conducted from November 28, 1970 through February 1, 1971 in Dade County, Florida are presented. A total of 583 industries were interviewed by telephone and 233 field inspections were made. Fifteen of the 89 industries with significant waste water discharges release wastes into water courses. These include two soft-drink processors and a paper mill. A major portion of the remaining industries, located at Miami International Airport, discharge potentially hazardous wastes from aircraft painting, stripping, and cleaning into canals emptying into the Miami River. These canals eventually become part of the main water supply for Miami, and pollutants discharged into them represent a potential hazard to the Miami water supply. Waste waters of 38 industries are discharged to the domestic sewer systems; some contain concentrations of heavy metals exceeding the criteria regulating the use of sanitary and storm sewers. Toxic compounds in waste water discharges of 36 industries become a source of pollution to the ground water aquifer underlying Dade County, because these wastes are discharged into 'dry wells'. (Davison-IPA)

FIELD INVESTIGATION OF TRACE METALS IN GROUNDWATER FROM FLY ASH DISPOSAL,
Notre Dame Univ., IN.
T. L. Theis, J. D. Westrick, C. L. Hsu, and J. J. Marley.
Journal Water Pollution Control Federation, Vol 50, No 11, p 2457-2469, November 1978. 13 fig, 6 tab, 21 ref. ERDA EY-76-S-02-2727.

Descriptors: *Fly ash, *Trace elements, *Metals, *Groundwater, Water quality, Waste disposal, Water pollution, Water pollution sources, Pollutants, Seepage, Lagoons, Iron, Arsenic, Zinc, Copper, Nickel, Manganese, Lead, Sampling, Powerplants, Fly ash disposal.

Field studies were conducted at the fly ash disposal site of a 735 MW coal-fired power plant. Disposal consisted of ponding the ash, followed by eventual removal, and ultimate deposition as fill. Several sampling wells were made in order to monitor the groundwater quality. Results indicated that trace metals are released to the groundwater from the pond at generally low levels. Metals were found to accumulate in soils at the point of confluence of the pond seepage water with the natural groundwater. Precipitation of insoluble phases and adsorption of metals onto the higher levels of hydrous iron and manganese oxides were considered responsible for this. Nickel was singular in that data suggest that no precipitates were formed and adsorption did not occur under the conditions at the site. (Sims-ISWS)

FATE OF HERBICIDES CNP IN RIVERS AND AGRICULTURAL DRAINAGES,
Kitakyushu Municipal Inst. of Environmental Health Sciences (Japan).
M. Suzuki, Y. Yamato, and T. Akiyama.
Water Research, Vol 12, No 10, p 777-781, 1978. 4 fig, 3 tab, 16 ref.

Descriptors: *Herbicides, Water pollution, *Farm wastes, Pollutants, *Pollutant identification, Chemicals, Chemical analysis, Sampling, On-site investigations, Laboratory tests, Chemistry, Water chemistry, Path of pollutants, *Water pollution sources, *Japan, *CNP residues.

The occurrence and fate of a herbicide CNP (2,4,6-trichlorophenyl-4'-nitro-phenylether) in rivers and agricultural drainages were investigated. CNP residues in water samples were extracted by adsorption on a macroreticular XAD-2 resin column and were subjected to gas chromatographic analysis using an electron capture detection after desorption from the column and concentration. The minimum detectable amount was 0.04 ng, and a positive identification of CNP residue in water samples was obtained with a combined gas chromatography-mass sptrometry-computer system when 500 ng of CNP was injected. CNP residues were detected in water samples taken in June to September, and these levels were between 0.01 and 16.67 microgram/liter. THe maximum level was found in a sample taken on 13 July 1977, about a month after beginning rice seedling transplantation, and the minimum level was detected on 29 August 1977. However, CNP residue levels were increased again in September because flooded water on the paddy fields was excluded. CNP was more persistent in the aquatic environment than a herbicide benthiocarb. A RECORD OF THE ACCUMULATION OF SEDIMENT AND TRACE METALS IN A CONNECTICUT, U.S.A., SALT MARSH,
Yale Univ., New Haven, CT.
R. J. McCaffrey.
PhD Dissertation, May, 1977. 148 p.

Descriptors: *Salt marshes, *Connecticut, *Trace elements, *Sedimentation rates, Wetlands, Marshes, Metals, Iron, Manganese, Copper, Land use, Air pollution.

Certain trace metals deposited in the salt marsh appear to behave in an analogous, conservative manner. Thus the historical rate of deposition of Mn, Fe, Cu, Zn, Pb, and total inorganic matter on the surface of the marsh may be calculated from the age and sediment properties measured at small depth increments. Changes in the inorganic matter content are attributed to variations in land use on the watershed since it was cleared for agriculture. Fe, Mn, and inorganic matter are principally derived from stream transport of eroding soil, while the observed increased in the fluxes of Cu, Zn, and Pb are largely explained as increased suplly via the atmosphere during the period of the deposition of trace metals from polluted air masses over long periods of time. PCB AND THE HOUSATONIC RIVER - A REVIEW AND RECOMMENDATIONS,
Connecticut Academy of Science and Engineering, Hartford; and Connecticut Univ., Storrs. Inst. of Water Resources.
Connecticut Academy of Science and Engineering, Hartford, Connecticut. 1978. B. C. Bell (Editor); A. W. Sweeton, III, Chariman of the ad hoc Technical Committee on Housatonic River Pollution. 25 p, 30 ref. OWRT A-999-CONN(17), 14-34-0001-9007.

Descriptors: *Polychlorinated biphebyls, *Coolants, Water pollution effects, *Public health, Fish, *Oysters, Dredging, Reviews, *Connecticut, *Economic effects, *Possible carcinogenicity, *Industrial origin, *Landfill leaching, Atmospheric fallout, *Housatonic River(Conn).

The Housatonic River is contaminated by polychorinated biphenyls (PCB), which is a class of toxic chemical compounds. These compounds have accumulated in the bottom sediments of the river during a period of over 40 years, largely as a result of their leakage into the river at the General Electric Company plant in Pittsfield, Massachusetts. Their extreme chemical inertness, which made them suitable for industrial application as cooling liquids in electrical capacitors and other electrical equipment, means that the concentration of PCB in the sediments has increased with time. The situation became critical several years ago, when it was discovered that fish in the river contained concentrations of PCB in excess of 5 parts per million, a limit set by the USFDA. Consequently, the State Department of Health in 1977 issued a health advisory against eating fish from the Housatonic. The current report, which is intended as a guide to policymakers, summarizes information about the chemical nature of PCB, the limited information about their toxicity, and the present situationon the Housatonic River. Its major recommendation is that this public health hazard is sufficiently serious that a sustained effort should be made to establish its parameters by monitoring the concentration of PCB in the Housatonic River, in other bodies of water in Connecticut, and in the drainage path of landfills. Other recommendations deal with the need to gain more precise information about PCB and with the exchange of information among the many different government agencies and private organizations that are concerned with different facets of the problem.

THE PESTICIDE CONTENT OF SURFACE WATER DRAINING FROM AGRICULTURAL FIELDS--A REVIEW,
Science and Education Administration, Stoneville, MS. Southern Weed Science Lab.
R. D. Wauchope.
Journal of Environmental Quality, Vol. 7, No. 4, p 459-472, October-December 1978. 3 fig, 4 tab, 69 ref.

Descriptors: *Pesticides, *Runoff, *Agricultural runoff, *Water pollution sources, *Reviews, Water pollution, Herbicides, Insecticides, Pesticide residues, Water quality, Rainfall, Storms, Sediments, Farm management, Agriculture, Bibliographies, *Nonpoint water pollution sources.

The literature on pesticide losses in runoff waters from agricultural fields was reviewed. For the majority of commercial pesticides, total losses are 0.5% or less of the amounts applied, unless severe rainfall conditions occur within 1-2 weeks after application. Exceptions are the organochlorine insecticides, which may lose about 1% regardless of weather pattern because of their long persistence; and soil surface-applied, wettable-powder formulations of herbicides, which may lose up to 5%, depending on weather and slope, because of the ease of washoff of the powder. Pesticides with solubilities of 10 ppm or higher are lost mainly in the water phase of runoff, and erosion control practices will have little effect on such losses. Organochlorine pesticides, paraquat, and arsenical pesticides, however, are important cases of pesticides which are strongly adsorbed by sediments, and erosion control can be important in controlling losses of these compounds. The behavior and fate of pesticides in streams receiving runoff is generally not known. Information on such factors as time and distance of impact of a given runoff event, ability of local ecosystems to recover from transient pesticide concentrations, and dissipation or concentration processes in aquatic ecosystems will have to be obtained before 'edge-of-field' pesticide losses can be related to water quality in receiving waters. (Sims-ISWS)

NUTRIENT RUNOFF FROM FERTILIZED AND UNFERTILIZED FIELDS IN WESTERN CANADA,
Department of Agriculture, Swift Current (Saskatchewan). Research Station.
W. Nicholaichuk, and D. W. L. Read.
Journal of Environmental Quality, Vol. 7, No. 4, p 542-544, October-December 1978. 2 tab, 13 ref.

Descriptors: *Nutrients, *Runoff, *Agricultural runoff, *Fertilizers, *Canada, Nitrogen, Phosphorus, Sediments, Erosion, Snowmelt, Crops, Wheat, Water quality, Water pollution, Water pollution sources, Chemicals, Chemical analysis, Sampling, *Saskatchewan(Canada).

Nutrient transport in surface runoff from snow was measured from fertilized and unfertilized cropped and summerfallowed Wood Mountain loam fields in semiarid southwest Saskatchewan. The amount of nitrogen lost from unfertilized fields during spring runoff exceeded the limits purported to result in algal growth; however, the loss was agronomically insignificant. It was concluded that since the N and P concentrations in runoff from unfertilized fertile agricultural soils exceed Saskatchewan Water Quality criteria, these guidelines may be regarded as unattainable under the present system of cereal cropping in western Canada. (Sims-ISWS)

BROMACIL IN LAKELAND SOIL GROUND WATER,
Southeastern Forest Experiment Station, Marianna, FL.
E. A. Hebb, and W. B. Wheeler.
Journal of Environmental Quality, Vol. 7, No. 4, p 598-601, October-December 1978. 1 fig, 1 tab, 21 ref.

Descriptors: *Herbicides, *Groundwater, *Pesticides, *Leaching, Sampling, Chemical analysis, Rainfall, Pesticide residues, Pollutants, *Path of pollutants, Water pollution, Water pollution sources, *Bromacil.

The objective of this study was to evaluate the probable magnitude of the problem of the leaching of pesticides into groundwater under extreme conditions: a sandy soil low in organic matter, a persistent and mobile herbicide applied at a high rate, plentiful rainfall, and a water table within 6 m. Bromacil (5-bromo-3-sec-butyl-6-methyl-uracil) was applied at the rate of 22 kg/ha to a Lakeland sand bearing scrub vegetation of small oaks and poor grasses. Groundwater (at depths ranging from 4.5 to 6 m) was sampled from bromacil residue at weekly intervals for 2 years. Residue was first found in the groundwater 3 months after application and was highest (1.25 ppm) 1 month later. Thereafter the amount declined to less than 0.1 ppm in about a year and less than 0.001 ppm in 2 years. Peaks in residues generally followed periods of increased rainfall by about 2 weeks. Residues (0.24 ppm) were still detected in the surface soil 2 years after application. (Sims-ISWS)

IN WHAT WAY IS WATER POLLUTION INFLUENCED BY SEWERAGE SYSTEMS,
DHV Consulting Engineers, Amersfoort (Netherlands).c
J. B. M. Wiggers, and K. Bakker.
Hydrological Sciences Bulletin, Vol. 23, No. 2, p 257-266, June 1978. 5 fig, 1 tab, 3 ref.

Descriptors: *Sewers, *Drainage systems, *Water pollution, *Model studies, Mathematical models, Combined sewers, Separated sewers, Storm drains, Storm runoff, Urban drainage, Urban hydrology, Storage, Design storm, Flooding, Overflow, Precipitation(Atmospheric), Design, Hydraulic design, Pollution abatement.

A sewerage system was defined, and the sources of pollution were described. The relationship between the amount of pollution and the hydraulic design criteria was outlined. It was shown that in flat or slightly undulating areas, the efficiency of sewer networks can be improved and their costs can be reduced without the need for detailed hydrological investigations. A simulation model of the pollution discharge was presented, and some of the results were discussed. One of the findings is that a combined sewer system can be as effective as a separate system in relation to surface water pollution. This needs to be verified in practice. In order to be able to choose the optimal solutions for pollution abatement, it is important to define the quality of surface water required in a much more accurate way than is done at present. MICROBIAL SULFUR CYCLE ACTIVITY AT A WESTERN COAL STRIP MINE,
Montana State Univ., Bozeman. Dept. of Microbiology.
G. J. Olson, and G. A. McFeters.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 722, Price codes: A05 in paper copy, A01 in microfiche. Montana University Joint Water Resources Research Center Montana State University, Research Report Number 98, November 1978. 79 p, 5 fig, 14 tab, 71 ref. OWRT A-108-MONT(1), 14-34-0001-8028.

Descriptors: *Water pollution, *Acid mine water, *Sulfur bacteria, *Coal mine wastes, *Strip mine wastes, Decker mine, Wyoming, Sulfate reducing organisms, Acidophilic iron organisms, Thiobacillus ferroxidans.

Certain groups of sulfur cycle bacteria found in waters, sediments, and the coal seams of a strip mine at Decker and other mines of southeastern Montana and northeastern Wyoming were studied. Thiobacillus ferrooxidans, one of the major contributors to acid mine drainage, was consistently detected in the mining environment. Physiological studies of T. ferrooxidans isolates indicated that these acidophilic iron and sulfur oxidizing organisms were typical of the species in their preference for low pH and ability to oxidize pyrite. Since (1) acidic conditions were never observed at Decker, (2) the isolates died off in mine water environments, and (3) no acid could be formed from coal samples inoculated with a T. ferrooxidans isolate, it was thought that their activity was limited to microzones in the coal bearing strata when they oxidized sulfuritic material. Any acid formed was quickly neutralized by bicarbonate heavy metals. Hydrogen sulfide and sulfate reducing bacteria were detected in the water from all but one of the wells samples in over a wide area in southeastern Montana. Although the activity of these organisms in the groundwater could not be demonstrated, a comparison of stable sulfar isotope ratios between groundwater sulfates and sulfides indicated the sulfide was likely produced by sulfate reducing bacteria. Descriptors: *Water pollution sources, *Saline water, *Groundwater, *Seepage, *Pollutant identification, *Trace elements, *Computer models, *Mathematical models, Water chemistry, Soil chemical properties, *Metals, *Montana saline seep areas, Thermodynamic equilibrium model, Ionic activity coefficient, Aluminum, Cadmium, Cobalt, Copper, Nickel, Lead and zinc.

Saline seep waters often contain concentrations of trace metals that are higher than those commonly encountered in non-polluted surface waters. These waters also contain extremely high concentrations of sodium, magnesium and sulfate. An equilibrium model has been developed that predicts the concentrations of aluminum, cadmium, cobalt, copper, nickel, lead, and zinc in the saline seep waters. Ionic activity coefficients are calculated from major component analyses data. Best agreement

between calculated and observed concentrations of trace metals is obtained for aluminum, copper, and lead. Agreement for cadmium and nickel is good provided the pH values are above eight. The solutions appear to be super saturated with respect to cobalt carbonate. Agreement for zinc is good for some samples but poor for others. (Hunt-Montana)

RAPID WEATHERING PROCESSES OF FUEL OIL IN NATURAL WATERS: ANALYSES AND INTERPRETATIONS,
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
F. Zurcher, and M. Thuer.
Environmental Science and Technology, Vol 12, No 7, p 838-843, July 1978. 3 fig, 1 tab, 21 ref.

Descriptors: *Weathering, *Oil pollution, *Laboratory tests, *Clay minerals, Fuels, Environmental effects, Resources development, Baseline studies, Suspended solids, Outer Continental Shelf, No. 2 fuel oil.

The fate-determining steps of weathering petroleum in the aquatic environment were studied in model experiments. Capillary column gas chromatography and infrared adsorption measurements showed different weathering processes for No. 2 fuel oil, depending on the turbulence and the level of suspended solids (kaolinite) in water during experiments. Partial dissolution, adsorption, dispersion, and agglomeration of No. 2 fuel oil initially occurred and resulted in the fractionation of the original oil mixture. Alkylated benzenes and naphthalenes were enriched in the water phase (up to 5 mg/l), certain aliphatic hydrocarbons above mol wt 250 were adsorbed onto kaolinite (200 mg/kg), and oil droplets were agglomerated with suspended minerals (20 g/kg) after increased turbulence. The same fractionation pattern was observed for a ground water oil spill, although the oil was already biochemically altered. (Sinha-OEIS)

COMPARISON OF ASSOCIATIONS OF DIFFERENT HYDROCARBONS WITH CLAY PARTICLES IN SIMULATED SEAWATER,
Michigan Univ., Ann Arbor. Dept. of Atmospheric and Oceanic Science.
P. A. Meyers, and T. G. Oas.
Environmental Science and Technology, Vol 12, No 8, p 934-937, August 1978. 3 fig, 1 tab, 13 ref.

Descriptors: *Clay minerals, *Oil pollution, *Sediments, *Water pollution, Pollutant identification, Laboratory tests, Hydrocarbons, Petroleum.

Some aspects of the association of hydrocarbons and smectite clay in simulated seawater were investigated using NaCl solutions in laboratory experiments. Both n-eicosane and n-eicosene displayed identical association behaviors with this clay. Association increased linearly with increasing hydrocarbon concentration in water. The amount of n-alkane associated with smectite increased with carbon chain length from C17 to C28, reaching a maximum of 70% removal from water. This may be due to decreased accommodation in water as hydrocarbon chain length becomes larger. The level of association of aromatic hydrocarbons was generally low, and isoalkanes were more effectively removed from water than n-alkanes of the same number of carbons. (Sinha-OEIS)

DISTRIBUTION OF POLYCHLORINATED BIPHENYLS (PCB) IN ESTUARINE ECOSYSTEMS. TESTING THE CONCEPT OF EQUILIBRIUM PARTITIONING IN THE MARINE ENVIRONMENT,
URS Co., Seattle, WA.
S. P. Pavlou, and R. N. Dexter.
Environmental Science and Technology, Vol 13, No 1, p 65-71. January 1979. 4 fig, 7 tab, 31 ref.

Descriptors: *Estuarine environment, *Polychlorinated biphenyls, *Ecosystems, Pollutant identification, Water pollution, Environmental effects, *Washington, Path of pollutants, Distribution, Outer Continental Shelf, *Puget Sound(WA).

Spatial and temporal trends in the chlorobiphenyl concentrations observed in various marine components of Puget Sound between 1973 and 1977 are presented. The distribution and accumulation characteristics are discussed in terms of the physical chemical processes that control their flow throughout the ecosystem. For the low levels detected in seawater, the data suggest that uptake is predominantly governed by equilibrium partitioning of the chemicals between suspended phases and ambient water. (Sinha-OEIS)

LIGHT HYDROCARBONS IN RECENT TEXAS CONTINENTAL SHELF AND SLOPE SEDIMENTS,
Texas A and M Univ., College Station. Dept. of Oceanography.
B. B. Bernard, J. M. Brooks, and W. M. Sackett.
Journal of Geophysical Research, Vol 83, No C8, p 4053-4061, August 20, 1978. 7 fig, 3 tab, 24 ref.

Descriptors: *Oil pollution, *Sediments, *Water pollution sources, *Texas, Microbial degradation, *Gulf of Mexico, Outer continental shelf, *Hydrocarbons.

The distributions of the concentrations of methane, ethene, ethane, propene, and propane in twelve 1- to 2-m long gravity cores for two transects from nearshore to midslope off the southwest Texas Gulf Coast are reported. Methane profiles exhibit maxima in the top 40 cm of sediment on the shelf, in contrast to downward increasing gradients in the slope region. Nearshore surface methane concentrations ranging from 50 to 400 micro l (normal temperature and pressure) per liter pore water are apparently due to microbial production in sulfate-free microenvironments such as fecal pellets in a near-seawater sulfate environment. A decrease in sediment methane levels to less than 5 micro l/l pore water in downslope sediments is attributed to reduced microbial activity due to lower organic contents and temperatures. Profiles of the saturated and unsaturated C2 and C3 hydrocarbons suggest that these gases are also microbially produced. (Sinha-OEIS)
W79-03371

AN EVALUATION OF OIL AND GREASE CONTAMINATION ASSOCIATED WITH DREDGED MATERIAL CONTAINMENT AREAS,
Engineering-Science, Inc./Texas, Austin.
C. T. White.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A048 595, Price codes: A08 in paper copy, A01 in microfiche. Army Engineer Waterways Experiment Station Technical Report No. D-77-25, November 1977. 154 p, 41 fig, 28 tab, 43 ref, append. DACW39-75-C-0125.

Descriptors: *Oil pollution, *Water pollution sources, *Environmental effects, *Dreding, Sediments, Waste disposal, Resources development, Outer Continental Shelf, Dredged material, Grease.

Field studies were conducted at six locations where dredging is practiced, and both water and sediment samples were collected at these sites. The samples were analyzed for various environmental factors with the intent of establishing whether or not release of oil and grease from dredged sediments could be predicted on the basis of the environmental factors. The results of the field study strongly indicated that oil and grease are not released from sediments to a significant extent during the dredging process. It was found that relatively high oil levels in return waters were associated with high suspended solids concentrations, but that the various factors could not be related to the release of oil and grease from sediments. A bench-scale study was devised to delineate the significant factors affecting the release of oil and grease from dredged sediments; however, no consistent relationships were found. The bench-scale results confirmed the field study results in that oil and grease concentrations in the water phase were quite low, even with particularly oily sediments. (Sinha-OEIS)

NEARSHORE DISPOSAL: ONSHORE SEDIMENT TRANSPORT,
Coastal Engineering Research Center, Fort Belvoir, VA.
R. K. Schwartz, and F. R. Musialowski.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A051 575, Price codes: A02 in paper copy, A01 in microfiche. Reprint No. 78-6, February 1978. Reprinted from: Coastal Sediments '77, p 85-101. 18 p, 8 fig, 7 ref.

Descriptors: *Sediment transport, *Dredging, *Environmental effects, *Erosion, Sedimentation, Spoil banks, *North Caroina, Outer Continental Shelf, Nearshore processes, Dredge disposal.

During the summer of 1976, 26,750 m of relatively coarse sediment was dredged from New River Inlet, N.C., moved downcoast using a split hull barge, and placed in a 215 m coastal reach between the 2 m and 4 m depth contours. Bathymetric changes on the disposal piles and in the adjacent beach-nearshore area were studied for a thirteen week period to determine the modification of the surrounding beach-nearshore profile and the net transport direction of the disposal sediment. Surveys showed accretion at the base of the foreshore, complete filling of the trough, a platform or new trough at the initial surf-zone bar position, disappearance of the surf-zone bar, and generally a more seaward surf zone boundary. Profiles adjacent to the disposal area showed slight accretion seaward of the surf zone. The predominant transport direction of disposal sediment is interpreted to have been shoreward into the surf zone (in the direction of the coarsest native sand) and then in the direction of the longshore current. The increased width of the platform-disposal bar complex may provide benefits by increasing the amount of wave energy dissipation in the surf zone and hence, less erosion of the beach. (Sinha-OEIS)

CONIFER NEEDLE PROCESSING IN A SUBALPINE LAKE,
Washington Univ., Seattle. Collo of Forest Resources.
G. H. Rau.
Limnology and Oceanography, Vol. 23, No. 2, p 356-358, March, 1978. 1 fig, 17 ref.

Descriptors: *Coniferous trees, *Needles, *Biodegradation, Underwater, Lakes, Lake sediments, Fir trees, Hemlock trees, Washington, Weight, Water pollution, Water pollution sources, Degradation(Decomposition), Findley Lake(Washington), Abies amabilis, Tsuga mertensiana, Waste disposal, Littoral.

The weight loss of fir (Abies amabilis) and hemlock (Tsuga mertensiana) needles introduced into a littoral benthic site in Findley Lake, Washington, was studied. The needles were contained in nylon mesh (0.8 x 0.8 mm or 0.073 x 0.073 mm square mesh) bags or skewered onto stainless steel pins housed in slotted plastic containers. Both fir and hemlock needles lost an average of 80-90% of their initial dry weight after 1-year of incubation. Considerably less mean weight was lost from needles in fine and coarse mesh bags. In all treatments there was little change in mean needle weight during the second year of the experiment. (Witt-IPC)

A STUDY OF NITRIFICATION IN THE DELAWARE RIVER ESTUARY,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Environmental Science.
R. B. Tiedemann.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 488, Price codes: A12 in paper copy, A01 in microfiche. MS Thesis, June 1977. 259 p, 45 fig, 53 tab, 49 ref, append. OWRT B-054-NJ(1), 14-31-001-5091.

Descriptors: *Estuaries, *Nitrification, *Ammonia, *Water quality, Denitrification, Nutrients, *Delaware River estuary, Benthal deposits, Growth dynamics.

The process of nitrification is evident in a variety of environments and has been studied in the terrestrial and upland river ecosystems. However, a minimum of work has been performed upon nitrification as it applies to the estuarine system. Nitrification in the Delaware River Estuary has been identified to seasonally occur within an upstream and a downstream region with a site of inhibition situated between the two. Nitrosomonas and Nitrobacter populations within the water were held accountable for the bulk of nitrification exhibited in the estuary. Assessments of benthic and wetlands nitrification were not conducted but are considered contributing mechanisms to the total expression of nitrification within the estuarine system. A combination of proper residence time and concentrations of NH3, NO-2, dissolved oxygen, and carbon allow significant nitrification to occur within the water with lengthy residence time being particularly unique to the estuary. Only a small nitrifying seed is required for nitrifying populations to build to considerable levels in the Delaware Estuary. The source of that seed has been reviewed in six hypotheses which may operate individually or in combination. A suggestion for future investigations is the identification of which hypothesized processes are active within the Delaware Estuary and to what degree. (Hunter-Rutgers)

USE OF SODIUM THIOSULFATE DECHLORINATED MUNICIPAL WATER IN SALMON CULTURE,
Weyerhauser Co., Springfield, OR.
B. J. Allee, and R. W. Anderson.
In: 26th Annual Northwest Fish Culture Conference, Dec 3-5, 1975, Otter Rock, Oregon, p 18-23, 1 tab, 7 ref.

Descriptors: *Bioassay, *Mortality, *Aquiculture, *Chlorination, De-chlorination, *Sodium thiosulfate, Fish hatchery, Fish physiology, Chemical analysis, Sodium thiosulfate, Saltwater survival, Enzymes, Gill ATP-ase levels, Blood chemistry, Waste treatment.

A bioassay was conducted assessing growth, freshwater survival, blood chemistry, gill-ATP-ase levels, and saltwater survival for coho salmon reared in sodium thiosulfate dechlorinated water and an unchlorinated control. No detrimental effects were observed in fish survival, growth, health, saltwater survival or gill ATP-ase levels when compared to a common source control. (EIS-Katz)

The selection of a waste heat management alternative for a steam-electric generating station and the level of sophistication of hydrothermal modelling used in the analysis of the alternative can only be efficient if related to three factors. These are: the stage of the study, the available environmental data, and the level of environmental/biological significance of the water body. The main thrust of this paper is to illustrate a simple methodology for effectively combining these various factors. (EIS-Deal)

SIMULATION ANALYSIS OF THE CONCENTRATION PROCESS OF TRACE HEAVY METALS BY AQUATIC ORGANISMS FROM THE VIEWPOINT OF NUTRITION ECOLOGY,
Kyoto Univ. (Japan). Dept. of Sanitary Engineering.
I. Acyama, Yos. Inoue, and Yor. Inoue.
Water Research, Vol 12, p 837-842, 1978. 7 fig, 1 tab, 8 ref.

Descriptors: *Mathematical models, *Simulation analysis, Food chains, Nutrient requirements, Heavy metals, Predation, Trophic level, Computer models, Mathematical studies, Fish food organisms, Food habits, Growth rates, *Bioaccumulation.

This paper proposed the food condition factor which unifies the population density and aggregation index of prey organisms from the viewpoint of the nutrition ecology in the case of modeling the concentration process of heavy metals by aquatic organisms. By using this factor we can generalize the food conditions when experiments on the biological concentration process of trace heavy metals through a food chain are performed. Simulation analysis on the concentration process of metals by a fish was made on the basis of the mathematical model described. (EIS-Deal)

PCB RESIDUES IN MULLET, MUGIL CEPHALUS, FED TO CAPTIVE EASTERN AUSTRALIAN WATER RATS, HYDROMYS CHRYSOGASTER,
Commonwealth Scientific and Industrial Research Organization Lyneham (Australia). Div. of Wildlife Research.
P. Woollard, and H. Settle.
Bulletin of Environmental Contamination and Toxicology, Vol 20, p 606-612, 1978. 1 fig, 3 tab, 10 ref.

Descriptors: *Polychlorinated biphenyls, *Mullets, *Pesticide residues, Rodents, Chemical analysis, Aroclors, Chlorinated hydrocarbon pesticides, Path of pollutants, Chromatography, *Australia, Pesticide kinetics, Commercial fishing, Water quality standards, *Tissue analysis, *Australian water rats.

During an investigation into levels or organochlorine pesticides in water rats, Hydromys chrysogaster, from an irrigation area in New South Wales, captive-raised water rats were found to contain polychlorinated biphenyl (PCB) residues. The most likely source of these residues was found to be mullet, Mugil cepha lus, the mahjor item of diet. The results of chromatographic analysis of fish and rat tissues for PCB levels were reported and possible paths of PCBs into fish tissues were suggested. (EIS-Deal)

5C. Effects Of Pollution

AN ASSESSMENT OF THE EFFECTS OF STORMWATER RUNOFF FROM URBAN WATERSHEDS ON THE WATER QUALITY OF A RECEIVING RESERVOIR,
Tennessee Univ., Knoxville.
S. Neperud.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 643, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis, March 1978. 87 p, 9 fig, 19 tab, 20 ref, 3 append. OWRT A-043-TENN(3).

Descriptors: *Storm runoff, Water quality, Urban runoff, Urban watersheds, *Tennessee, *Stormwater, *Water quality standards, Dissolved oxygen, Total solids, *Fort Loudon Reservoir(Tenn), Reservoirs.

The purpose was to determine the effects of stormwater runoff on the water quality of Fort Loudon Reservoir. The experimental data were obtained from samples taken from Fort Loudon Reservoir before, during, and after runoff events as well as from samples taken during dry weather (control conditions). Grab samples were taken at three specific sites at one-hour intervals for the duration of the sampling period. Each sample was immediately analyzed at the Knoxville, Tennessee, Third Creek Wastewater Treatment Plant. Water quality parameters obtained were dissolved oxygen, pH, biochemical oxygen demand, conductivity, temperature, total solids, and fecal coliform bacteria. Twenty-five test runs were made. No significant water quality changes were observed between control values and those obtained after the addition of stormwater runoff into the reservoir, although for the low intensity storm monitored, the values did fluctuate a great deal. Total solids and dissolved oxygen violated stream standards on two occasions.

CITRIC ACID ENHANCEMENT OF COPPER SULFATE TOXICITY TO THE BLUE-GREEN ALGAE APHANIZOMENON FLOS-AQUAE AND MICROCYSTIS AERUGINOSA,
Missouri Univ.-Kansas City. Dept. of Biology.
Lisa LaVaughan Ray.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 637, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis, 1978. 83 p, 13 fig, 23 tab, 56 ref, append. OWRT A-099-MO(1). 14-34-0001-7053 and 7054.

Descriptors: *Copper sulfate, Citric acid, Algae, Algicide, *Cyanophyta, Toxicity, Toxicity tests, Aphanizomenon, Microcystis, Water pollution effects.

Copper toxicity tests were carried out using two species of blue-green algae, Aphanizomenon flos-aquae and Microcystis aeruginosa. Copper concentrations of 300 micrograms/liter or higher inhibited the growth of Aphanizomenon. The addition of 600 micrograms Cu++/liter was the minimum copper concentration necessary to inhibit Microcystis growth over a 14-day experimental period. Copper solubility and cupric ion toxicity were enhanced by the addition of citric acid. Citric acid had no adverse effects on the algicidal properties of copper sulfate. A ratio of citric acid at eight times the weight of copper sulfate pentahydrate at a copper concentration of 500 micrograms/liter (8:1 citrate-copper sulfate mixture) was inhibitory to Microcystis growth over a 14-day period, whereas the addition of 500 micrograms Cu++/liter alone was not. The 8:1 mixture had the same effects as the addition of 600 micrograms Cu++/liter. The increased cupric ion toxicity was not due to a pH effect.

EFFECT OF CARBON DIOXIDE ON PIGMENT AND MEMBRANE CONTENT IN SYNECHOCOCCUS LIVIDUS,
Massachusetts Univ., Amherst. Dept. of Microbiology.
L. S. Miller, and S. C. Holt.
Archives of Microbiology, Vol. 115, p 185-198, 1977. 24 fig, 1 tab, 33 ref. OWRT-A-069-MASS, 14-31-0001-4021

Descriptors: *Cyanophyta, *Carbon dioxide, Nutrients, *Electron microscopy, *Pigments, *Synechoccus lividus, *Cyanobacteria, Bleaching-regreening, Chlorophyll, Water pollution effects, Thylakoid membrane, C-phycocyanin, Chlorophyll a.

The effect of carbon dioxide on pigment and membrane content in Synechococcus lividus was studied by depriving cells of CO2 and examing cell populations biochemically and by electron microscopy. After 120 hr of CO2 deprivation, S. lividus lost all detectable chloropyll a and C-phycocyanin. Such bleached cultures were 'mustard yellow', the result of approximately 1.8 times more carotenoid per cell than green control cultures. Although cells from bleached cultures appeared morphologically indentical to control green cells when examined by light microscopy, electron microscopic examination revealed them to be devoid of detectable thylakoid membrane. Thylakoid membrane could not be recovered by physical isolation or revealed by freeze etching of bleached S. lividus. In addition, inclusion bodies characteristically found in s. lividus were also absent. Reintroduction of CO2 into bleached cultures resulted in a rapid resynthesis of both chloropyll a and C-phycocyanin. Electron microscopic examination of these regreening cultures revealed that thylakoid membrane was also rapidly resynthesized. Growth of regreened cultures did not occur until there was the synthesis of a full complement of chlorophylla, C-phycocyanin, and thylakoid membrane. A time course study of the cytological events occurring during bleaching and regreening is presented.

METHYLOTROPHIC ENZYME DISTRIBUTION IN METHYLOSINUS TRICHOSPORIUM,
Ohio State Univ., Columbus. Dept. of Microbiology.
T. L. Weaver, and P. R. Dugan.
Journal of Bacteriology, Vol. 122, No. 2, p. 433-436, May 1975. 2 fig, 2 tab, 22 ref. OWRT A-027-OHIO(6).

Descriptors: *Enzymes, *Methane, Centrifugation, Distribution, Bacteria, Cytological studies, *Methylosinus trichosporium, *Methylotrophic enzyme, *Methane oxidation, *Methane fixation, Electron transport, Cytochrome, Membrane fractions, Phosphorylation.

Key enzymes involved in the oxidation and fixation of methane by Methylosinus trichosporium were examined for localization within the bacterial cells. A differential centrifugation scheme following cell disruption was used to provide membrane and soluble fractions for the enzyme assays. All the methylotrophic enzymes examined were found to be soluble with the practionation scheme. Electron transport involving a cytochrome C2 with absorption peaks at 416, 522, and 550 nm and oxidative phosphorylation were found in the membrane fractions. Mixed soluble and membrane fractions coupled the oxidation of methanol and formate with cytochrome reduction. (Chao-Ohio).

ULTRASTRUCTURE OF METHYLOSINUS TRICHOSPORIUM AS REVEALED BY FREEZE ETCHING,
Cornell Univ., Ithaca, NY. Lab. of Microbiology.
T. L. Weaver, and P. R. Dugan.
Journal of Bacteriology, Vol. 121, No. 2, p. 704-710, February 1975. 9 fig, 12 ref. OWRT A-027-OHIO(5).

Descriptors: Methane, Membrane, Etching, Bacteria, Cytological studies, *Methylosinus trichosporium, Methane-oxidizing bacteria, *Freeze etching, Cytoplasm.

The methane-oxidizing bacterium Methylosinus trichosporium forms extensive intracytoplasmic membranes that lie near the cell periphery and parallel to it. These membranes enclose cavities within the cytoplasm and exist as flattened, balloon-like vesicles. The internal membranes are passed along to both cells during budding. The bacteria accumulate poly-B-hydroxybutyrate granules that lie in the center of the cells, neither within the internal membrane vesicles nor attached to them. Intercellular bridges result in the formation of chains of bacteria two to four cells in length. (Chao-Ohio).

LOCALIZATION OF CHITIN IN ALGAL AND FUNGAL CELL WALLS BY LIGHT AND ELECTRON MICROSCOPY.

Purdue Univ., Lafayette, IN. Dept. of Botany and Plant Pathology.
N. L. Pearlmutter, and C. A. Lembi.
The Journal of Histochemistry and Cytochemistry, Vol. 26, No. 10, April 1978, p 782-791, 3 fig. OWRT B-081-IND (1).

Descriptors: *Algae, *Aquatic fungi, *Chlorophyta, Cytological studies, *Pithophora oedogonia, *Blastocladiella emersonii, *Chitin.

Chitin was visualized in cell walls after hydrolysis with potassium hydroxide and subsequent postfixation of the deacetylated polysaccharide (chitosan) in OsO4. Areas of chitin deposition appeared dark brown by light microscopy and electron dense in the electron microscope. With this method, the presence of chitin was demonstrated in the cell walls of the green alga Pithophora oedogonia (Montagne) Wittrock and two fungi, Ceratocystis ulmi Buism. (C. Moreau) and Blastocladiella emersonii Cantino and Hyatt. Most of the chitin in P. oedogonia was found in the crosswall disk and small amounts occurred in the outer longitudinal walls. The spetal disk of C. ulmi also contained chitin, but significant amounts were present in the inner and outer regions of longitudinal walls as well. Chitin was present throughout the walls of B. emersonii. Small amounts of chitin were not easily demonstrated by this technique, but removal of chitosan by exposure to dilute acetic acid before osmium fixation disrupted cell wall integrity, suggesting that small amounts of the structural polysaccharide had been removed.

DYNAMICS OF POLYCHLORINATED BIPHENYLS IN THE UPPER MISSISSIPPI RIVER, FINAL REPORT. PHASE 1, TASK 1, COMPILATION OF INFORMATION,
URS Co., Seattle, WA.
R. N. Dexter, S. P. Pavlou, W. G. Hines, and D. A. Anderson.
Fish and Wildlife Service Report, April 1978. 71 p, 2 fig, 1 tab, 154 ref. 14-16-0009-78-026.

Descriptors: *Environmental effects, *Polychlorinated biphenyls, Model studies, *Mississippi River, Sediment transport, *Translocation, *Distribution, Aquatic habitats, Aquatic insects, Aquatic plants, Plankton, Benthos, Hydrology, Sediments, Water quality, Lakes, Wetlands, Rivers, Movement, Sediment transport, Path of pollutants, Bioaccumulation, Chemical partitioning, *Lake Onalaska, *Diagnostic models, *Literature surveys.

A program was undertaken by the Columbia National Fishery Research Laboratory to investigate the distribution and impact of polychlorinated biphenyls (PCB's) in the Upper Mississippi River in the vicinity of Lake Onalaska. The goal of the program is to develop a diagnostic model to show the extent of PCB contamination in the ecosystem, to identify potential factors for controlling PCBs in this area, and, most importantly, provide a capability for predicting other contaminant crises prior to occurrence. The first task, which is reported here, was to identify published and unpublished sources of information and on-going studies related to the study. The report includes an outline of the overall study, an annotated bibliography of related information, and a list of persons contacted with types of information they have available. An evaluation of the information is presented in the report subtitled, 'Task 2: Evaluation of Compiled Information'. (See W79-03119) (Little-FWS)

DYNAMICS OF POLYCHLORINATED BIPHENYLS IN THE UPPER MISSISSIPPI RIVER, FINAL REPORT PHASE 1, TASK 2: EVALUATION OF COMPILED INFORMATION,
URS Co., Seattle, WA.
R. N. Dexter, W. G. Hines, E. Quinlan, and S. P. Pavlou.
Fish and Wildlife Service Report, July 1978. 87 p, 20 fig, 4 tab, 26 ref, 1 append.

Descriptors: *Polychlorinated biphenyls, Model studies, *Mississippi River, Rivers, Lake Onalaska, Lakes, *Hydrology, Sediment transport, Flow rates, Electrical conductance, Distribution, Path of pollutants, Winds, Fish, Water circulation, Sedimentation, Water quality, Plankton, Runoff, *Environmental effects, Aquatic habitats, Aquatic animals, *Diagnostic models, *Literature reviews, Sources, Bioaccumulation, Chemical partitioning.

A program was undertaken by the Columbia National Fishery Research Laboratory to investigate the distribution and impact of polychlorinated biphenyls (PCB's) in the Upper Mississippi River in the vicinity of Lake Onalaska. The goal is to develop a diagnostic model to show the extent of PCB contamination in the ecosystem, identify potential factors for controlling PCB's in the area, and provide a capability for predicting other contaminant crises prior to occurrence. Part of the initial phase of developing the model was to evaluate the applicability of existing information identified in 'Task 1: Compilation of Information'. (See W79-03118) The analysis reported here describes the study area and considers the physical characteristics (hydrology and sedimentation) of the system and the distribution and movement of PCB's. Important observations were made regarding flow rates in the main river channel and Lake Onalaska; sediment type and movement; and PCB sources, distribution and transport. Subject areas where information is lacking were also noted. (Little-FWS)

CHANGES IN ZOOPLANKTON POPULATIONS IN THE WHITE VOLTA WITH PARTICULAR REFERENCE TO THE EFFECT OF ABATE,
Ghana Inst. of Aquatic Biology, Achimota.
J. Samman, and J. P. Thomas.
International Journal of Environmental Studies, Vol. 12, No. 3, 1978, p 207-214. 7 fig, 7 ref.

Descriptors: *Abate, *Water pollution effects, *Insecticides, *Zooplankton, *Thermocyclops hyalinus, *Lethal limit, *White Volta River, *Toxicity, *Reservoirs, *River basins, *Ghana, Volta River Basin, Simulium damnosum, Onchocerciasis, Public health, Human diseases, Copepods, Larvicides, Pesticides, Vertical migration, Diel migration, Crustaceans, Cladocera, Spraying, Rivers.

Laboratory tests for toxicity determined the 24-hr LC50 of the nauplii of Thermocyclops hyalinus using the insecticide Abate CE 200 (used to destroy Simulium damnosum for onchocerciasis control in the Volta River Basin) at 0.23 ppm. The 24-hr LC50 of the copepodite and adult stages of T. hyalinus, the dominant zooplankter in the basin, was 0.2 ppm. Pre- and post-sunset drift samples were also collected at the outflow of the reservoir created at Daboya, Ghana, where the White Volta empties into Volta Lake, December 1975-September 1976 before and after weekly aerial spraying with Abate was begun January 1976. Though the concentration of Abate introduced into the reservoir was much higher than the 24-hr LC50 of T. hyalinus, the microcrustacean population appeared tto be unaffected, probably because: (1) microcrustacea drifting into the reservoir from upstream sustained reservoir populations, (2) zooplankton living at the banks of the reservoir escaped effects of Abate flowing downstream, and (3) the spraying was done around mid-day when the majority of the zooplankton population had migrated to the bottom. Numbers of drifting zooplanktonic microcrustacea in the White Volta increased March-July (dry season), and there was normally an increase in numbers of microcrustacea in night samples, probably related to the vertical migration of the zooplankton in the reservoir upstream. Drift samples contained Copepoda, Cladocera, and Chaoboridae. (Lynch-Wisconsin)
W79-03173

EFFECT OF AN ORGANOPHOSPHORUS INSECTICIDE, ABATE, USED IN THE CONTROL OF SIMULIUM DAMNOSUM ON NONTARGET BENTHIC FAUNA,
Ghana Inst. of Aquatic Biology, Achimota.
J. Samman, and M. P. Thomas.
International Journal of Environmental Studies, Vol. 12, No. 2, 1978, p 141-144. 1 fig, 2 tab, 10 ref.

Descriptors: *Abate, *Insecticides, *Organophosphorus pesticides, *Simulium damnsoum, *Benthic fauna, *Oti River(West Africa), *Onchocerciasis, *Human diseases, *Public health, *Toxicity, *Ghana, Invertebrates, Insects, Water pollution effects, Pollutants, Pesticides, Rivers, Baetidae, Leptophlebiidae, Larvicides, Spraying, Volta River Basin, River basins.

Effects of Abate, an organophosphorus insecticide, on nontarget benthic fauna were investigated in the River Oti in northern Ghana. Two of three predominating organisms, Baetidae and Leptophlebiidae, were seriously affected by the larvicide; other nontarget organisms killed included Gomphidae, Libellulidae, and Dytiscidae. Abate toxicity was relatively insignificant to other taxa, particularly Neoplerla sp and Orthocladinae. Abate is used in the Volta River Basin in the Onchocerciasis Control Program to destroy the disease-carrying organism Simulium damnosum. Previous studies of the effect of Abate on nontarget organisms have produced inconsistent results. In this study Abate CE 200 was sprayed from the air on the river near its point of entry into Volta Lake. A surber sampler was used to collect predosing samples on 22 March 1977 from 2:00-5:00 pm at two sites, one covered by flat-surfaced rock (Site R) and one made up of gravels (Site G). The insecticide was sprayed from 400 m at 9 am on 23 March 1977, and postdosing samples were collected 2-4 pm the same day. Dosage at the sampling site was estimated at 0.01-0.05 ppm for about 30 min. More taxa and numbers were collected from Site G than from Site R. The presence of several taxa only at the former site indicates a lack of uniformity in distribution of benthic invertebrates in the riverbed. (Lynch-Wisconsin)

EFFECTS OF CHROMIUM ON SOME AQUATIC PLANTS,
Environmental Assessment Council, Inc., New Brunswick, NJ.
J. Mangi, K. Schmidt, J. Pankow, L. Gaines, and P. Turner.
Environmental Pollution, Vol. 16, No. 4, p 285-291, August 1978. 4 fig, 8 ref.

Descriptors: *Chromium, *Water polluton effects, *Algae, *Duckweed, *Toxicity, *Susquehanna River, *Bioaccumulation, New York, Plant growth, Absorption, Pollutants, Aquatic plants, Rivers, Ecosystems, Lemna minor, Chlorophyta, Spirodela polyrrhiza, Palmella mucosa, Oedogonium, Hydrodictyon reticulatum, Palmellococcus protothecoides.

Chromium, as Cr(VI), Cr04(=), was moderately toxic to four riverine chlorophyte algal species, and less so to two duckweed species (Lemna minor and Spirodela polyrrhiza). Samples collected primarily in the upper Susquehanna River in New York at the Pennsylvania border were supplemented by algal samples from the Tioughnioga and Chenango rivers. Algal species included Palmella mucosa, Oedogonium sp, Hydrodictyon reticulatum, and Palmellococcus protothecoides. Accumu-

lation of chromium by living and dead plant tissue was extensive and could have important effects on the river ecosystem. Growth of all plants was inhibited by 10 ppm chromium. Unicellular algae (Palmella and Palmellococcus) declined in cell numbers after two weeks, while the filamentous forms (Oedogonium and Hydrodictyon) showed weight loss. Both duckweed species grew during the two weeks, but less so than in controls. Among algae, a percentage of healthy looking cells and filaments remained amid the bleached, distorted ones. Effects of lower chromium doses were mixed, though uptake was approximately linearly correlated with background concentration. Since chromium was taken up by dead cells, absorption appears largely responsible for uptake; much of the chromium was localized on cell walls. Under laboratory conditions enough chromium is absorbed to detoxify the medium, which appears to allow some cells to survive and reestablish the population. Outermost cells may remove enough chromium to protect inner cells. (Lynch-Wisconsin)

CHANGES IN THE AQUATIC MACROPHYTE FLORA OF WHITEWATER LAKE NEAR SUDBURY, ONTARIO FROM 1947 TO 1977,
Guelph Univ., (Ontario). Dept. of Botany and Genetics.
H. M. Dale, and G. E. Miller.
The Canadian Field-Naturalist, Vol. 92, No. 3, p 264-270, July-September 1978. 1 fig, 3 tab, 12 ref.

Descriptors: *Macrophytes, *Whitewater Lake(Ontario Canada), *Water pollution effects, *Bioindicators, *Urban runoff, *Mine wastes, *Municipal wastes, Industrial wastes, Storm drains, Lakes, Ontario(Canada), Canada, Abundance, Water crowfoot, Ranunculus trichophyllus, Myriophyllum exalbescens, Potamogeton amplifolius, Potamogeton gramineus, Potamogeton natans, Potamogeton praelongus, Floating heart, Nymphoides cordatum, Water marigold, Megalodonta beckii, Heteranthera dubia, Pontederia cordata.

Comparison of a June-July 1977 survey of macrophytes in Whitewater Lake, near Sudbury, Ontario, Canada, with a survey conducted by Soper in 1947 before the lake was enriched and disturbed by recent release of municipal and industrial effluents shows that several species have decreased in abundance, five are now extinct, and only two have increased significantly. Of four new species recorded, two were rare and two were probably misidentified in 1947. Species now apparently extinct are wild rice (Zizania aquatica), lesser duckweed (Lemna minor), and Potamogeton foliosus, all rare in 1947, and floating heart (Nymphoides cordatum) and water marigold (Megalodonta beckii), both abundant in 1947. Species abundant in 1977 but rare or occasional in the earlier survey are water star grass (Heteranthera dubia) and pickerel weed (Pontederia cordata). The increase in water star grass appears due to its greater tolerance combined with reduced competition from other species. Six species can be classed as indicators based on their adverse reaction to the waste effluents: water crowfoot (Ranunculus trichophyllus), North American water milfoil (Myriophyllum exalbescens), and four pondweeds (Potamogeton amplifolius, P. gramineus, P. natans, and P. praelongus). Storm drains from the village of Azilda discharge into the lake, which also receives indirect drainage high in copper, nickel, and iron (and with a pH of 7.8) from a mining operation tailings dump. (Lynch-Wisconsin)

ECOLOGICAL STUDIES ON INDONESIAN LAKES, THE MONTANE LAKES OF BALI,
Cambridge Univ. (England). Dept. of Biology.
J. Green, S. A. Corbet, E. Watts, and O. B. Lan.
Journal of Zoology, Vol. 186, No. 1, September 1978, p 15-38. 6 fig, 7 tab, 19 ref.

Descriptors: *Bali(Indonesia), *Eutrophication, *Danau Bratan(Indonesia), *Danau Batur(Indonesia), *Danau Buyan(Indonesia), *Danau Tamblingan(Indonesia), *Mountain lakes, Limnology, Phytoplankton, Zooplankton, Water chemistry, Indonesia, Islands, Lakes, Mountains, Ecology, Guppies, Poecilia reticulata, Aquatic plants, Fisheries, Urbanization, Water pollution effects, Conductivity, Hydrogen ion concentration, Biological communities, Invertebrates, Alpine.

our Balinese Mountain lakes were surveyed 15-25 August 1974, two of which (Danau Bratan at 1231 m and Danau Batur at 1031 m) were studied in 1929 by the German Sunda Expendition. While Danau Batur, larger than Danau Bratan (15.9 vs 3.8 sq km) and with very high conductivity (1650 micromho/cm at 20 C), showed little change since 1929, unproductive Danau Bratan, with very low conductivity (39 micromho/cm), showed changes in water chemistry and plankton composition which may reflect slight cultural eutrophication. The previously unstudied lakes, Danau Buyan and Danau Tamblingan (both at 1214 m), lie in the same caldera as Danau Bratan; water quality of all three lakes appears similar to 1929. If so, Danau Tamblingan has hardly changed, Danau Buyan has changed little, and Danau Bratan has changed much more. The latter has been subjected to the heaviest human pressure, followed by Danau Buyan and inaccessible Danau Tamblingan; Danau Batur is being developed as a tourist center. The three adjacent lakes are contrasted in terms of stability of stratification, plankton composition, vegetation, marginal fauna, guppy diet, and fisheries, and differences are related to wind exposure and effects of human settlement. Changes in Danau Bratan since 1929 include; (1) doubling of conductivity from 18 to 39 micromho/cm, (2) a pH change from 6.8 to 7.1, (3) end of desmid dominance of phytoplankton, and (4) marked zooplankton species composition changes. Descriptors: *Baltic Sea, *Nutrients, *Limiting factors, *Eutrophication, *Primary productivity, *Organic matter, Seas, Phytoplankton, Deep water, Halocline, Algae, Phosphorus, Nitrogen, Ammonia, Phosphates, Hydrogen sulfide, Trophic level, Water pollution effects, Sewage treatment, Oxygen depletion, Anaerobic conditions, Aerobic conditions.

The reason for increasing eutrophication in the Baltic Sea may be alternating oxic and anoxic conditions, and phosphate may be the most limiting factor for phytoplankton production. Nitrogen is always available, for example as ammonia. The Baltic is a semienclosed basin with a positive water balance; oxygen in deep water becomes depleted and nutrients accumulate. Deep water oxygen conditions are regulated by the water exchange ratio in the Danish sounds, in the supply of organic matter, and the oxidation rate. Organic matter is brought in by river water, inflowing bottom water from the Kattegatt, precipitation, and effluents, and is produced by the sea itself through biological processes. Biological production is regulated by sunlight, light penetration, temperature, supply of nutrient salts, vitamins, hormones, trace metals, and other factors. A previous study showed only 10% of annual organic matter supply in the sea would produce anoxic conditions in deep water below the halocline. The Baltic has very low surface water nutrient levels but large concentrations in deep water. Hydrogen sulfide is formed and phosphate is dissolved from sediments during anoxic periods, and with return of oxic conditions sediment phosphorus is again renewed through precipitation of iron phosphate. With inflow of new water to deep areas, accumulated nutrients are washed to the surface through thermohaline convection, causing surface fertilization. (Lynch-Wisconsin)

ASSESSING CHANGES IN BIOMASS OF RIVERBED PERIPHYTON,
Guelph Univ. (Ontario). Dept. of Zoology.
W. K. Liaw, and H. R. MacCrimmon.
Internationale Revue der Gesamten Hydrobiologie, Vol. 63, No. 2, 1978, p 155-171. 4 fig, 14 tab, 19 ref.

Descriptors: *Periphyton, Rivers, *Grand River(Ontario Canada), *Benthic flora, *Artificial substrates, *Methdology, River beds, Algae, Biomass, Riffles, Ontario(Canada), Canada, Organic matter, Primary productivity, Substrates, Suspended solids, Speed River(Ontario Canada), Scour, Respiration, Grazing, Chlorophyll, Detritus, Invertebrates.

Measurement of losses and gains of periphyton in a downriver riffle of the Grand River, a large river in Ontario, Canada, using concrete blocks and attached glass slides as substrates, showed that periphyton is a significant source of suspended organic matter in rivers of relatively unwooded basins. Concrete blocks were better as a substrate than glass slides; periphyton was well-established on the blocks toward the end of the study period (May-December 1971), similar to that on native rocks in terms of biomass, carbon and nitrogen content, and ratio of biomass to chlorophyll-a. Average accumulation rate of periphyton on glass slides (which were replaced monthly) was 266.2 mg/sq m/day ash-free wt, 120.9 carbon, 20.4 nitrogen, and 1.11 chlorophyll-1. On concrete blocks average accumulation rate was 590.0 mg/sq m/day ash-free wt, 202.9 carbon, 22.8 nitrogen, and 2.95 chlorophyll-a. Standing biomass of periphyton on glass slides varied from 0.7 g/sq m in December to 21.6 g/sq m May-June, with an average of 8.6 g/sq m. On concrete blocks biomass ranged from 29.9 g/sq m in October to 132.5 g/sq m in August, with a mean of 66.1 g/sq m. Comparison of biomass of periphyton on slides and on concrete blocks provided an estimated of the average rate of loss (from scour, respiration, and grazing) of periphyton from concrete blocks at 2.9 g/sq m/day, which is 63% of the mean total accumulation rate of the periphyton. DISTRIBUTION AND ABUNDANCE OF PHYTOPLANKTON IN 153 LAKES, RIVERS, AND POOLS IN THE NORTHWEST TERRITORIES,
Canada Environmental Protection Service, Yellowknife (Northwest Territories).
J. W. Moore.
Canadian Journal of Botany, Vol. 56, No. 15, August 1978, p 1765-1773. 2 fig, 2 tab, 47 ref.

Descriptors: *Lakes, *Rivers, *Temporary pond stage, *Phytoplankton, *Northwest Territories(Canada), *Basic data collections, *Distribution, *Abundance, *Arctic, *Cold regions, Algae, Ponds, Canada, Dinobryon bavaricum, Dinobryon cylindricum, Dinobryon sociale, Dinobryon divergens, Cyclotella glomerata, Cyclotella ocellata, Diatoms, Great Slave Lake(Northwest Territories Canada), Great Bear Lake(Northwest Territories Canada), Mackenzie River(Northwest Territories Canada).

Phytoplankton were surveyed 1975-77 in 153 lakes, rivers, and temporary pools in Canada's Northwest Territories, an area lying above a latitude of about 55 degrees and comprising the largest expanse of freshwater in the world. Dinobryon bavaricum was the most abundant and widespread species, occurring in almost all collections, followed by D. cylindricu, D. sociale, and D. divergens. Predominant diatoms were Cyclotella glomerata nd C. ocellata, both of which reached greatest abundance in lakes and rivers of the high arctic and were

completely absent from temporary pools (a distribution almost certainly related to turbulence). Although Asterionella formosa, Diatoma tenue var. elongatum, and Melosira islandica were common in Great Slave Lake and other southern lakes, they were rare or absent north of latitude 65 degrees. Chlorophyta (particularly Ankistrodesmus falcatus and Scenedesmus spp.) occurred in almost all collections but always in low numbers. Planktonic Cyanophyta, primarily Oscillatoria limnetica, were normally rare. Most samples were collected in the western arctic and subarctic, with additional collections in the arctic archipelago as far north as Ellesmere Island. Collections were usually made at 5-m depth intervals to maximum depth. The predominance of Dinobryon spp. parallels phytoplankton records of Alaska, Scandinavia, and the Quebec-Labrador Peninsula. Densities of dominant algae in this study were considerably lower than in northern and alpine Europe, central Canada, and Alaska. (Lynch-Wisconsin)

A METHOD FOR THE ANALYSIS OF ENVIRONMENTAL FACTORS CONTROLLING PATTERNS OF SPECIES COMPOSITION IN AQUATIC COMMUNITIES,
Manitoba Univ., Winnepeg. Dept. of Zoology.
R. H. Green, and G. L. Vascotto.
Water Research, Vol. 12, No. 8, 1978, p 583 590. 3 fig, 3 tab, 61 ref.

Descriptors: *Methodology, *Analytical techniques, *Species composition, *Cluster analysis, *Classification, *Lakes, *Zooplankton, Ontario(Canada), Canada, Environmental effect, Parameters, Water chemistry, Statistical models, Model studies, Computer models, Pollutants, Water pollution effects, Species diversity, Diversity indices.

Analytical methods for determining effects of environmental parameters on biological species composition are analyzed: (1) methods which reduce biological data, such as species abundance, to a more usable form (including ordination and classification methods, and diversity indices); and (2) methods which relate these reduced data to environmental data. The procedure recommended is classification (or cluster) analysis of biological data, followed by multiple discriminant analysis of species assemblage groups on the environmental variables. An example illustrating the procedure is given, applications of these methods to pollution studies is discussed, and possible modifications and extensions are considered. The example utilizes data from Patalas (1971) on abundance of 27 zooplankton species in 34 lakes in northwestern Ontario, Canada. Values for 11 morphometric and chemical variables in each lake were obtained from two published sources; variables included area, maximum depth, conductivity, total dissolved solids, calcium, magnesium, sodium, potassium, iron, nitrogen, and phosphorus. Results may show a pollution species assemblage whose samples are located only in the impact part of the study area and are separated from other species assemblage groups by a discriminant function with high coefficients only on the pollutant variables. ECOLOGICAL GENETICS OF TROUT ADAPTED TO GEOTHERMALLY HEATED WATERS OF YELLOWSTONE PARK,
Montana State Univ., Bozeman. Dept. of Biology.
D. G. Cameron, E. R. Vyse, and D. Browne.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 766, Price codes: A03 in paper copy, A01 in microfiche. Montana University Joint Water Resources Research Center, Montana State University, Research Report Number 97. October 1978. 31 p. OWRT A-107-MONT(1), 14-34-0001-8028.

Descriptors: Fish environment, *Water temperature, *Fish genetics, *Enzymes, Fish behavior, Environmental effects, Proteins, Montana, Wyoming, *Thermal water, *Rainbow trout, Firehole River(Mont), *Yellowstone Park, Isozymes, Alleles, Heterozygosity, Reproduction.

The electrophoretic mobility of proteins extracted from tissues of rainbow trout inhabiting highly atypical thermal regimes with water temperatures reaching 29.5 degrees C was measured. Measured levels of heterozygosity (H) and allelic homologies in these fish were not significantly different from those found in cold water and hatchery rainbow trout of South Central Montana. As no unique alleles could be inferred from the products of the 6 polymorphic loci in the fish of the warmer waters, no genetic adaptation was apparent. Concurrent laboratory work failed to indicate any unusual heat tolerance, and the lack of apparent evolutionary change suggests these fish survive at the physiological limits of their heat tolerance. ENVIRONMENTAL ASPECTS OF A WELL BLOWOUT IN THE GULF OF MEXICO,
Texas A and M Univ., College Station. Dept. of Oceanography.
J. M. Brooks, B. B. Bernard, T. C. Sauer, Jr, and H. Abdel-Reheim.
Environmental Science and Technology, Vol 12, No 6, p 695-703, June 1978. 11 fig, 4 tab, 18 ref.

Descriptors: *Environmental effects, *Gases, *Water pollution, *Blowouts, Sediments, *Gulf of Mexico, Resources development, *Outer Continental Shelf, *Natural seeps, Hydrocarbons.

Studies were conducted around a well blowout site on the Texas continental shelf that resulted in the escape of large quantities of gas and creation of a crater 95 m deep and 500 m wide. Four months after the blowout a plume of suspended sediment and gas continued to emanate from the crater at a seep rate of 10 x 10,000,000 L/day. At this time molecular and isotopic analyses of the seeping gas indicated that the gas was principally of biogenic origin (predominantly methane and delta 13C of -60o/oo) and not accompanied by any brine seepage. The seep gas did, however, contain a small thermocatalytic component as evidenced by the Cl/(C2+C3) ratio and its liquid hydrocarbon content (1.23 mg/L). Measurements of gaseous and liquid hydrocarbons dissolved in the water in the vicinity of the seep indicated rapid dilution of the high concentrations observed over the plume. The depth to which sediments were redeposited around the crater was determined by carbon isotope measurements on the carbonate fraction of the sediment. Analysis of hydrocarbons in redeposited sediments indicated that the original blowout gas was of predominantly thermocatalytic origin, containing higher concentrations of C2-C14 hydrocarbons than are presently seeping from the blowout. The impact of the blowout on temperature, salinity, dissolved oxygen, DOC, POC, TSM, helium, CO2, SigmaCO2, and sulfate in the waters and sediment near the crater is also discussed. (Sinha-OEIS)

HYDROCARBONS IN THE MARINE ENVIRONMENT OF PORT VALDEZ, ALASKA,
Alaska Univ., Fairbanks. Inst. of Marine Science.
D. G. Shaw, and B. A. Baker.
Environmental Science and Technology, Vol 12, No 10, p 1200-1205, October 1978. 1 fig, 5 tab, 19 ref.

Descriptors: *Alaska, *Biota, *Sediments, *Oil pollution, Resources development, Water pollution, Baseline studies, Environmental effects, Outer Continental Shelf, Hydrocarbons, Natural seepages, *Port Valdez(AK).

Saturated and unsaturated hydrocarbons were quantitatively determined in biota, water and sediments of Port Valdez, Alaska. These analyses show kinds and amounts of hydrocarbons typical of unpolluted nearshore marine environments. Common, prominent compounds include pristane, heptadecane, odd chain length normal alkanes with 21-31 carbon atoms, and a triterpene tentatively identified as squalene. Environmental samples for this work were collected during the period of approximately one year prior to the completion of the trans-Alaska oil pipeline. The operation of a tanker loading facility associated with that pipeline at Valdez will result in a controlled input of petroleum into Port Valdez. The results presented here provide a basis from which to investigate the fate of that added oil. (Sinha-OEIS)

ACCUMULATION OF SATURATED HYDROCARBONS IN TISSUES OF PETROLEUM-EXPOSED MALLARD DUCKS (ANAS PLATYRHYNCHOS),
New Orleans Univ., LA. Center for Bio-Organic Studies.
G. C. Lawler, W. Loong, and J. L. Laseter.
Environmental Science & Technology, Vol. 12, No. 1, p. 47-54, January 1979. 3 fig, 1 tab, 20 ref.

Descriptors: *Oil pollution, *Pollution effects, *Ducks(Wild), *Labortory tests, Resources development, Water pollution, Environmental effects, Hydrocarbons, Anas platyrhynchos.

Mallard drakes were dosed with 5 mL a day of South Louisiana crude oil for 14 days. Tissues from control and experimental ducks were then examined for petroleum hydrocarbons by combined high-resolution gas chromatography and mass spectrometry. Three characteristics of the saturated hydrocarbon fraction were used to assess the presence of crude oil: the n-alkane distribution pattern, the presence of homologous series of petroleum-derived hydrocarbons, and the n-C17/pristane ratio. Oil was found in every experimental tissue examined but the brain. The skin (and underlying adipose tissue) contained the highest level of saturated petroleum hydrocarbons. The other tissues were ranked related to the skin as follows: skin goes to uropygial gland goes to breast muscle, goes to heart muscle goes to liver goes to brain. The blood contained low levels of petroleum-derived hydrocarbons 3-4 hr after the final dose of crude oil. That saturated petroleum hydrocarbons did not accumulate in the duck tissues in the same relative amounts observed in South Louisiana crude oil suggested selective uptake and/or metabolism. TMP (THERMOMECHANICAL PULPING) EFFLUENTS -- A REVIEW,
Pulp and Paper Research Inst. of Canada, Pointe Claire (Quebec).
A. Wong, D. Breck, and J. Costantino.

Tappi, Vol. 61, No. 8, p. 19-22, August, 1978. 3 fig, 14 ref, 3 tab.

Descriptors: *Pulp wastes, *Toxicity, *Biochemical oxygen demand, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Effluents, Pine trees, Fir trees, Spruce trees(Picea), *Thermomechanical pulping.

The state-of-the-art of thermomechanical pulping (TMP) effluents is summarized as follows: The toxicity of TMP effluents is species-dependent; pine effluent is more toxic than spruce or fir effluent and softwood effluent is more toxic than hardwood effluent. For a given wood species and age of wood since felling, effluent toxicity is not affected by TMP conditions. Unlike toxicity, the BOD of TMP effluents is not dependent on species. BOD loading is slightly more dependent on TMP conditions than toxicity. High steam pressure will give a higher BOD loading and a lower pulp yield. For a given species, the toxicities and BOD loadings of TMP and stone groundwood effluents are comparable. Most of the toxicity and BOD appear to be released in the first stage of a 2-stage TMP system. The chip washing operation, plug screw feeder effluent, and pulp cyclone condensate contribute insignificant loadings of toxicity and BOD to the total TMP effluent. (Swichtenberg-IPC)

LAKE QUALITY DISCRIMINANT ANALYSIS,
Michigan State Univ., East Lansing. Dept. of Resource Development.
K. Reckhow.
Water Resources Bulletin, Vol. 14, No. 4, p 856-867, August 1978. 3 fig, 2 tab, 13 ref.

Descriptors: *Water quality control, *Lakes, *Eutrophication, *Discriminant analysis, *Phosphorus, Dissolved oxygen, Equations, Oxic-anoxic transition point, Estimating, Probability, Prediction, Model studies, Systems analysis.

Despite the fact that lake phosphorus loading criteria have proven to be valuable tools in lake management, they are generally subjective in nature or incomplete in form. In order to address these shortcomings, the oxic-anoxic transition point was selected as an objective quality criterion and discriminant analysis was used to construct a lake classification junction. This function is dependent upon lake phosphorus loading, mean depth, and overflow rate. The value of the function may be expressed as a probability of classification (as either oxic or anoxic). When used in prediction, inclusion of the input error permits the estimation of the change in classification probability as input uncertainty is reduced. Further, the form of the discriminant function suggests that the annual volumetric loading is a more informative term for the expression of phosphorus loading than is the annual areal loading. EFFECTS OF ARSENATE ON GROWTH AND PHOSPHORUS METABOLISM OF PHYTOPLANKTON,
Fisheries and Marine Service, Winnipeg (Manitoba).
D. Planas, and F. P. Healey.
Journal of Phycology, Vol. 14, p 337-341, 1978. 2 fig, 2 tab, 30 ref.

Descriptors: *Arsenic compounds, *Metabolism, *Phytoplankton, *Toxicity, *Growth rates, Phosphorus, Cytological studies, Aquatic algae, Ochromonas, Chlamydomonas, Anabaena, Mortality, Biochemistry, Absorption, Phosphates, Photosynthesis, Respiration, *Arsenate, Melosira, Cryptomonas.

The response to arsenate in growth and phosphate uptake by five algae in culture varied considerably. The growth rates of Melosira granulata and Ochromonas vallesiaca were depressed by 1 microM arsenate. Chlamydomonas reinhardtii required 10 microM for the same degree of depression, while the growth rates of Cryptomonas erosa and Anabaena variabilis were unaffected up to 100 microM. However, following depletion of phosphate, cultures of the latter two algae began to die at the higher concentration of arsenate tested. Growth of C. reinhardtii in the presence of 35 microM arsenate resulted in characteristics of P deficiency. Comparison of rates of photosynthesis, respiration, and phosphate uptake between cultures of C. reinhardtii which had grown in the presence and absence of arsenate showed little evidence after 16 doublings that it had adapted to arsenate. COEXISTENCE OF TOXIC AND NONTOXIC DINOFLAGELLATES RESEMBLING GONYAULAX TAMARENSIS IN NEW ENGLAND COASTAL WATERS (NW ATLANTIC),
Bigelow Lab. for Ocean Sciences, West Boothbay Harbor, ME.
C. M. Yentsch, B. Dale, and J. W. Hurst.
Journal of Phycology, Vol. 14, p 330-332, 1978. 1 fig, 1 tab, 9 ref.

Descriptors: *Algal toxins, *Red Tide, *Dinoflagellates, Toxicity, Aquatic populations, Shellfish, Bottom sediments, Growth stages, Systematics, Classification, Plankton, Biochemistry, Bioassay, Chemical analysis, New England, Gonyaulax.

Two forms resembling Gonyaulax tamarensis coexist in Maine coast plankton; one is toxic, the other is nontoxic. At times, red patches of dinoflagellates were identified as G. tamarensis, yet only presumed to be toxic. These two forms are not easily distinguished by conventional microscopic observations, nor by pigment analysis. Preliminary observations suggest that the nontoxic form is smaler than G. excavata and lacks the 'excavated' ventral region. Characteristic G. excavata resting cysts were found in sediments from the shellfish toxic area off Newagen and Monhagen (Maine) and were not found in sediments from areas where the nontoxic form bloomed. There appear to be a minimum of two G. tamarensis-like organisms. Full systematic treatment of these must await further information. (EIS-Deal)

CALCIFICATION AND CATION SORPTION OF CLADOPHORA GLOMERATA (CHLOROPHYTA),
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
C. S. Sikes.
Journal of Phycology, Vol. 14, p. 325-329, 1978. 2 fig, 1 tab, 53 ref.

Descriptors: Chlorophyta, *Calcium, *Absorption, *Metabolism, *Cladophora, *Cation adsorption, Calcium carbonate, Carbon dioxide, Photosynthesis, Enzymes, Biochemistry, Membrane processes, Cations, Bicarbonates, Chemical reactions, Growth rates, Aquatic algae, Strontium, Radioactivity techniques, Pectin.

Calcium sorption by Cladophora glomerata grown in continuous-flow culture increased substantially as the alga aged. This reflected increased pectin layered in thickening cell walls followed by deposition of $CaCO_3$ around cells. The high levels of pectin may account for the plant's reported high affinity for cations. The onset of carbonate deposition coincided with the appearance of carbonic anhydrase activity in cells. This suggests that carbonate deposition may be a function of bicarbonate use as a source of CO_2 for photosynthesis. Calcium uptake appears to occur by active transport in that it exhibited saturation kinetics, occurred against a concentration gradient, depended on light, and was nearly abolished by treatments that allow diffusion. Although strontium competed for Ca for binding sites of pectin, it did not inhibit internal transport of Ca. Consequently, the proposed carrier may be specific for Ca. (EIS-Deal)
W79-03445

TOXICITY OF BISULFITE TO PROTOSYNTHESIS AND RESPIRATION,
Montana Univ., Missoula. Dept. of Biology.
R. P. Sheridan.
Journal of Phycology, Vol 14, p 279-281, 1978. 5 fig, 12 ref.

Descriptors: *Toxicity, *Photosynthesis, *Respiration, Inhibitors, Sulfur compounds, Growth rates, Water pollution effects, Air pollution effects, Metabolism, Aquatic algae, Phytoplankton, Industrial wastes, *Bisulfite, *Sulfur dioxide, Chlorococcum.

Inhibition of photosynthesis in Chlorococcum sp. by bisulfite ion was the reciprocal of the light intensity curve. Respiration was least affected by bisulfite after endogenous substrate was reduced by incubation in darkness. Maximum reduction in growth occurred with bisulfite treatment at or above optimal growth temperatures. Maximum phytotoxicity correlated with conditions resulting in maximum metabolic activity. (EIS-Deal)
W79-03446

TOXICITY IN RESTING CYSTS OF THE RED-TIDE DINOFLAGELLATE GONYAULAX EXCAVATA FROM DEEPER WATER COASTAL SEDIMENTS,
Oslo Univ. (Norway). Dept. of Marine Biology and Limnology.
B. Dale, C. M. Yentsch, and J. W. Hurst.
Science, Vol. 201, p. 1223-1225, 1978. 2 fig, 8 ref.

Descriptors: *Red tide, *Algal toxins, *Dinoflagellates, *Toxicity, *Bottom sediments, Growth stages, Commercial shellfish, Eutrophication, Human pathology, Animal pathology, Mortality, Algal poisoning, Food chains, Dredging, Gonyaulax, Saxitoxin.

For the first time, Gonyaulax excavata cysts have been shown to be toxic. Bottom sediments from a water depth of 90 meters off the Maine coast were extremely rich in cysts, which were approximately ten times more toxic than the corresponding motile stages. Cysts are probably ingested by shellfish, thereby causing shellfish toxicity in deeper water offshore and contributing to shellfish toxicity in shallower coastal waters. A new approach to the problem of paralytic shellfish poisoning is therefore needed, one that takes into account benthic cysts and sedimentary factors affecting their distribution. The possible dangers of spreading poisoning through human activities must be considered. (EIS-Deal)

ENDRIN AND MALATHION TOXICITY TO FLAGFISH (JORDANELLA FLORIDAE),
Environmental Research Lab.-Duluth, MN.
R. O. Hermanutz.
ARCHIVES of Environmental Contamination and Toxicology, Vol. 7, p. 159-168, 1978. 1 fig, 4 tab, 16 ref.

Descriptors: *Pesticide toxicity, *Endrin, *Bioassay, *Insecticides, Mortality, Growth rates, Fish reproduction, *Toxicity, Chemical properties, Pesticide residues, Juvenile growth stage, Organophosphorus pesticides, Chlorinated hydrocarbon pesticides, Water pollution effects, *Malathion, *Flagfish, Jordanella.

Endrin and malathion effects on survival, growth, and reproduction of flagfish were determined in a flow-through system. Endrin chronic effects on first-generation growth and reproduction occurred

nly at 0.3 microg/l, the highest concentration ested. The mean endrin residues in the first-gen-eration fish at 65 days were about 15,000 times the water concentrations tested. Malathion concentra-ion of 31.5 microg/l and 24.7 microg/l, the high-st concentration tested, had detrimental effects on irst-generation survival. During the same period nalathion concentration as low as 10.9 microg/l ignificantly affected growth. Neither insecticide, t the concentrations tested, had any detectable effects on the second generation during a 30-day exposure period. Acute toxicities to juvenile fish were also determined in the same flow-through ystem. (EIS-Deal)

THE BIOGEOCHEMISTRY OF HEAVY METALS IN POLLUTED LAKES AND STREAMS AT FLIN FLON, CANADA, AND A PROPOSED METHOD FOR LIMITING HEAVY-METAL POLLUTION OF NATURAL WATERS,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
T. A. Jackson.
Environmental Geology, Vol. 2, No. 3, p. 173-189, 1978. 14 fig, 6 tab, 70 ref.

Descriptors; *Heavy metals, Effluents, *Waste reatment, *Zinc, *Cadmium, *Copper, *Mercury, *Iron, Mine wastes, Industrial wastes, Geochemis-ry, Biochemistry, Chemical analysis, Eutrophica-ion, Bottom sediments, Sewage effluents, Aquatic lgae, Seston, *Smelter wastes.

The biogeochemistry of Zn, Cd, Cu, Hg, and Fe in lakes and streams polluted by mines and smelter wastes emitted at Flin Flon, Canada, was investigated. In Schist Lake, a repository for both tailings-pond drainage and sewage, green algal blooms generated by nutrients from sewage promote entrapment of metals in sediments by (1) accumulation of metals from solution by algal seston, with preferential uptake of Zn, the most abundant metal, followed by sinking of the seston; and (2) production of H2S during decomposition of dead algae, resulting in sulfide precipitation. Metals are partially resolubilized from seston as it decomposes while sinking. In bottom muds, partitioning of a metal between sulfide and organic matter is strongly dependent on the stability of the metal sulfide as measured by its standard entropy. Metals were concentrated in H2S-rich muds and extraction of muds with various solvents and by electrodialysis showed that sulfide was much more effective than organic matter in suppressing remobilization of metals. These results indicate that introduction of sewage together with heavy-metals effluents into settling ponds could be an effective and economic method for limiting heavy-metal pollution of natural waters. REQUIREMENT OF RAINBOW TROUT FOR DIETARY ZINC,
Tokyo Univ. of Fisheries. (Japan). Lab. of Fish Nutrition.
O. Ogino, and G. -Y. Yang.
Bulletin of the Japanese Society of Scientific Fisheries, Vol. 44, No. 9, p. 1015-1018, 1978. 2 fig, 6 tab, 5 ref.

Descriptors: *Rainbow trout, *Zinc, *Fish diets, Fish physiology, Trace elements, Metals, Water chemistry, Fish diseases, Animal pathology, Animal metabolism, Growth rates, Mortality, Toxicity, Nutrient requirements, Iron, Copper, *Tissue analysis.

The requirement of rainbow trout for dietary zinc was investigated by feeding them with diets containing graded levels of zinc. The results of the present study demonstrate that zinc is an essential trace element in the diet of rainbow trout, even though rearing water contains a low concentration of this element (11 microg/l). The fish fed a diet low in zinc content (1ppm) showed an extremely low growth rate and high mortality. A large number of the fish on the zinc-deficient diet were found to suffer from cataracts in the eyes and erosion of the fins and of the skin. The dietary zinc levels also influenced the digestibility of protein and carbohydrate, especially that of protein. The proximate composition of the fish body and the contents of trace elements in the various organs varied according to the dietary zinc levels. Judging from the growth rate of the fish, an adequate zinc content of the diet of rainbow trout was estimated to be 15 to 30 ppm. (EIS-Deal)

ON CHANGES IN THE DENSITY AND SHAPE OF PULP WASTES IN PAPER MILL EFFLUENT AND RIVER WATER OF THE FUJI DISTRICT BEFORE AND AFTER TREATMENT OF THE EFFLUENT (IN JAPANESE),
Takai Univ., Shizuoka (Japan). Faculty of Marine Science and Technology.
T. Mizushima.
Bulletin of the Japanese Society of Scientific Fisheries, Vol. 49, 1978, No. 9, p. 989-997. 4 tab, 7 fig, 6 ref.

Descriptors: *Water pollution effects, *Pulp wastes, Pulp and paper industry, On-site-investigations, Sediments, Industrial wastes, Methodology, Pollutant identification, Pollution abatement, *Particulate matter, *Japan, *Particulate length, *Particle weight.

The Hedoro pollution of Tagonoura Bay by paper mill effluent from the Fuji district is reported to have improved markedly in recent years. In order to determine the mechanism of this improvement, a study was made of the particulate matter pulp wastes present in the effluent within the paper mill of highest production and in the river water of the Fuji district. This report presents the main results of a comparison of the particulate matter before and after treatment of the effluent. (1) It was found that in the river water the water sampling method resulted in collection of a greater proportion of small waste particles, whereas the net sampling method took mainly large waste particles. (2) The comparison with the waste present in the effluent within the mill showed a sharp decrease in weight (to 1/300), number (to 1/44), and mean length (1/3.3), and a marked change in the shape distribution of the particulate matter. (EIS-Katz)

Canada Water Resources Journal, Vol 3, No 3, p 121-133, 1978. 6 fig, 2 tab, 1 ref.

Descriptors: *Nuclear powerplants, *Thermal pollution, *Mollusks, Mortality, Toxicity, Heated water, Water temperature, Cooling water, Thermal stress, *Aquatic algae, Water pollution effects, Scenedesmus, Gastropods, Growth rates, Animal metabolism, Phytoplankton, Pediastrum, Thermal effluent.

The paper deals with the effects of an increase in water temperature caused by the operation of the Gentilly Nuclear Power Station on the physical characteristics of the environment and on some species of mollusc. The results show an increase in the temperature in the discharge cone of almost 10C when the reactor is operating at maximum power. In this situation, mortality among the molluscs increases to the point where they disappear completely. An outline of the simulation studies that were made on a few unicellular algae is also presented. (EIS-Deal)

MIGRATORY BIRD MANAGEMENT AND INDUSTRIAL COOLING IN NORTHERN CLIMATES,
Canadian Wildlife Service, Edmonton (Alberta). Western and Northern Region.
R. W. Prach, and D. C. Surrendi.
Canadian Water Resources Journal, Vol 3, No 3, p 11-120, 1978. 3 tab, 9 ref.

Descriptors: *Migratory birds, *Mallard duck, *Thermal pollution, Animal behavior, Ducks(Wild), Canada, Migration patterns, Overwintering sites, Mortality, Thermal powerplants, Heated water, Water temperature, Cooling waters, Environmental effects, Water pollution sources, Wildlife management, *Thermal effluent.

Migratory birds overwintering at Lake Wabasmun, Alberta, were investigated. Data are given on numbers and species composition. Overwintering mallards were studied in detail. Open water appears to be the major factor causing mallards to overwinter. Overwintering mallard populations for 1976-77 and 1977-78 were approximately 3,000 and 700 birds respectively. Sex ratios tend to be biased towards males because of the greater tendency for females to migrate and higher mortality for those females remaining. Problems and opportunities available to resource managers as a result of warm water effluent are discussed. (EIS-Deal)

Veroffentlichungen des Instituts fur Meeresforschung in Bremerhaven, Vol 18, p 95-100, 1978. 1 fig, 2 tab, 3 ref.

Descriptors: Oil, *Oil pollution, *Mortality, *Water birds, Toxicity, Oil spills, Gulls, Water pollution effects, Organic compounds, Phosphothicate pesticides, Pesticide toxicity, Animal pathology, *Parathion, *Kittiwakes, Tissue analysis, Guillemots.

Between January and April 1978, 116 dead or moribund sea birds were collected at Helgoland beaches. 56 birds, mostly guillemots and kittiwakes died from an oil pollution of unknown origin and extension. The majority of 60 unoiled birds, mostly kittiwakes and herring gulls, exhibited symptoms of poisoning. Methyl parathion could be identified in one of the herring gulls. (EIS-Deal)

THE EFFECT OF IN VIVO EXPOSURE OF ENDRIN ON THE ACTIVITIES OF ACID, ALKALINE AND GLUCOSE-6-PHOSPHATASES IN LIVER AND KIDNEY OF OPHIOCEPHALUS (CHANNA) PUNCTATUS,
D.A.V. Coll., Muzaffarnagar (India). Dept. of Zoology.
K. V. Sastry, and S. K. Sharma.
Bulletin of Environmental Contamination and Toxicology, Vol 20, No 4, p 456-460, 1978. 1 tab, 19 ref.

Descriptors: *Enzymes, *Endrin, *Pesticide toxicity, *Chlorinated hydrocarbon pesticides, Pesticide kinetics, Fish physiology, Animal metabolism, Biochemistry, *Toxicity, Water pollution effects, Path og pollutants, Proteins, Tissue analysis, Channa, Liver, Kidney.

The effects of in vivo exposure of a sublethal concentration of endrin on the activities of acid, alkaline and glucose-6-phosphatases in the liver and kidney of Ophiocephalus punctatus was studied. The period of exposure was twenty days. In the liver, alkaline phosphatase and glucose-6-phosphatase activities were decreased but acid phosphatase was stimulated. Kidney showed stimula-

tion in the activity of all the three phosphatases. (EIS-Deal)

EFFECTS OF SELECTED HEAVY METALS ON EARLY LIFE OF SOCKEYE AND PINK SALMON,
International Pacific Salmon Fisheries Commission, New Westminster (British Columbia).
J. A. Servizi, and D. W. Martens.
Progress Report No. 39, 1978. 26 p, 13 tab, 3 fig, 29 ref.

Descriptors: *Toxicity, *Mortality, Bioassay, Methodology, *Metals, *Cadmium, *Copper, *Mercury, Water pollution effects, Freshwater fish, *Salmon, Sockeye salmon, Pink salmon, Juvenile fish, Fish eggs, Juvenile growth stage, Growth rates, Biological membranes, *Biological concentration, Malformation.

Sockeye and salmon were exposed continuously to cadmium, copper, and mercury under laboratory conditions during the egg to fry stage. Observations of mortality, hatching, development and growth were used to evaluate toxic effects. Mortality, hatching, and growth of sockeye salmon during the egg to fry stage were not affected by continuous exposure to 5.7 microg/l cadmium. However, the 168 hr LC50 for first feeding fry was 8 microg/l cadmium. When exposed to copper, the incipient lethal level was between 37 and 78 for sockeye but between 25 and 55 microg/l for pink salmon during the egg to fry stage. Growth and hatching were no better than mortality as indicators of toxic effects of copper. Copper inhibited egg capsule softening, but associated mortalities during hatching occurred only at concentrations also lethal to eggs and alevins. Copper was concentrated by eggs, alevins and fry in proportion to exposure concentrations. Copper concentrations of 105 and 6.8 ppm in pink salmon eyed eggs and fry, respectively, coincided with mortalities. Continuous exposure of eggs to 2.5 microg/l mercury caused malformed embryos at hatching. Mortality, growth, and hatching were less sensitive to mercury than was malformation. Mercury was concentrated by sockeye and pink salmon in proportion to exposure concentration during the egg to fry stage. Mercury concentrations of 1.87 ppm in eyed eggs coincided with malformed embryos at hatching. (EIS-Katz)

SUBLETHAL EFFECTS OF WEST POINT TREATMENT PLANT EFFLUENT ON COHO SALMON,
Municipality of Metropolitan Seattle, WA.
J. A. Buckley, and C. M. Whitmore.
In: Proceedings of the Northwest Fish Culture Conference, 25th Anniversary, Dec 4-6, 1974, Seattle, p 3-7, 1 tab, 2 fig.

Descriptors: *Toxicity, *Bioassay, Water treatment, *Washington, *Salmon, Laboratory tests, *Sewage, Sewage disposal, Sewage effluents, Sewage treatment, Ammonia, Chlorine, Nitrogen compounds, Fish physiology, Treatment plant outfall, Hemoglobin, Hematology, Sublethal effects, Sublethal stress.

Results indicate no significant stress to test fish exposed to 0.3 percent effluent. However, sublethal stress did occur to fish exposed to 1.1 percent effluent which approximates the concentration of effluent in the immediate area of the treatment plant outfall when poor mixing conditions prevail. Such conditions would be unlikely to occur for more than a very short time and in a small area adjacent to the diffuser. Of the measures of sublethal stress used in the study, hemoglobin and information from blood smears were the most valuable. (EIS-Katz)

EVIDENCE OF RESISTANCE TO METALS IN LARVAE OF THE MIDGE CHIRONOMUS TENTANS IN A METAL CONTAMINATED LAKE,
Purdue Univ., Lafayette, IN. Dept. of Bionucleonics.
R. Wentsel, A. McIntosh, and G. Atchison.
Bulletin of Environmental Contamination and Toxicology, Vol 20, No 4, p 451-455, 1978. 1 fig, 3 tab, 3 ref.

Descriptors: *Heavy metals, *Diptera, *Mortality, *Midges, Bioassay, Toxicity, Larval growth stage, Animal physiology, Animal metabolism, Adaptation, Resistance, Lakes, Eutrophication, Cadmium, Zinc, Chromium, Chemical wastes, Industrial wastes.

Chironomid larvae were collected from two areas of a lake, one contaminated by heavy metals and one uncontaminated, and subjected to a series of tests to determine if metal resistant strains have developed within the lake. Only 47.5% of the larvae from the unpolluted region survived in highly contaminated sediment used in the 96-hour bioassay. Chironomids obtained from the polluted region of the lake had a survival rate of 75%, suggesting that this population may be somewhat resistant to heavy metal contamination. (EIS-Deal)

LOWERING OF SERUM THYROXINE AND TRIIODOTHYRONINE LEVELS IN YEARLING COHO SALMON, ONCORHYNCHUS KISUTCH, BY DIETARY MIREX AND PCBS,
Guelph Univ. (Ontario). Dept. of Zoology.
J. F. Leatherland, and R. A. Sonstegard.
Journal of the Fisheries Research Board of Canada, Vol. 35, No. 10, p. 1285-1289, 1978. 3 fig, 14 ref.

Descriptors: *Fish physiology, *Polychlorinated biphenyls, *Sockeye salmon, *Toxicity, Fish diets, Growth rates, Animal metabolism biochemistry, Proteins, Chlorinated hydrocarbon pesticides, Pesticide toxicity, Path of pollutants, Fish behavior, Pesticide residues, *Mirex, Tissue analysis, *Thyroxine, Hormones.

Yearling coho salmon were fed diets contaminated with PCBs or a mixture of Mirex and PCBs daily for 2 or 3 mo. Serum T3 and T4 levels were significantly reduced in fish fed the high Mirex diet for 2 or 3 mo. Serum T3 levels were reduced in fish fed the high PCB diet for 3 mo. Serum T3 and T4 levels were significantly reduced in fish fed the Mirex-PCB diet for 3 mo. The significant increase in serum T3/T4 ratios in fish given the high Mirex or high PCB diet was not evident in fish given the mixed Mirex-PCB diet, suggesting a synergistic effect that is different from the effect of individual contaminants. Fish given the high PCB or high Mirex diet had significantly lower body weights than the control fish. (EIS-Deal)

CHROMIC ACID IN ASSIMILATION STUDIES - A CAUTION,
Colorado Univ., Boulder. Dept. of Environmental, Population, and Organismic Biology.
S. H. Bowen.
Transactions of the American Fisheries Society, Vol 107, No 5, p 755-756, 1978. 4 ref.

Descriptors: Fish physiology, *Fish food organisms, Periphyton, Animal metabolism, Chemical properties, Water chemistry, Acids, Biochemistry, Absorption, Digestion, Path of pollutants, *Chromic acid, Tissue analysis, Bioaccumulation, *Sarotherodon.

Chromic oxide is frequently used as a reference compound to measure assimilation of food components by fishes and other animals. Experiments using juvenile Sarotherodon mossambicus indicated that the fish was able to reject chromic oxide when it was added to their diets. It was hypothesized that other fish may possess this ability. This possibility should be considered before the accuracy of the chromic oxide reference techniques are assumed. (EIS-Deal)

EFFECTS OF SEDIMENT ADDITION ON MACROBENTHIC INVERTEBRATES IN A NORTHERN CANADIAN RIVER,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
D. M. Rosenberg, and A. P. Wiens.
Water Research, Vol 12, p 753-763, 1978. 5 fig, 5 tab, 31 ref.

Descriptors: *Channels, *Sediment load, *Bottom sediments, Sediments, Channel morphology, Benthic fauna, Seasonal, Oligochaetes, Stoneflies, Mayflies, Diptera, Habitats, Canada, Particle size, Suspended solids, Construction, Pipelines, Biological communities, Animal behavior, Insect drift.

Two channels built into the Harris River, Northwest Territories were used to study responses of invertebrates to sediment addition. Sediment was added to one channel continuously for approximately 5 h. The other channel was used as a control. As a result of sediment addition, numbers of macrobenthos drifting from the sediment addition channel increased significantly over those drifting in the control in August and September. Significantly higher numbers of macrobenthos drifted in fall than summer. Numbers of macrobenthos drifting during sediment addition were significantly related to time in fall but not in summer, indicating a seasonal difference in temporal response to sediment addition. Seasonal, Pulp and paper industry, Chemical wastes, Bioassay, Heat resistance, Water temperature, Fish physiology, Mortality, Animal metabolism, Carbohydrates.

Acute toxic responses to bleached kraft pulpmill effluent were compared for groups of underyearling rainbow trout reared under constant temperature and either a summer or winter photoperiod. Toxicity tests included a 96-h LC50 bioassay, a 4.5-h sealed-jar test, an 18-h temperature tolerance test, and a 4-h blood-sugar stress bioassay. For all tests the threshold-effect concentration of effluent was not affected by photoperiod. (EIS-Deal)

CHRONIC TOXICITY OF WATER-BORNE AND DIETARY LEAD TO RAINBOW TROUT (SALMO GAIRDNERI) IN LAKE ONTARIO WATER,
Canada Centre for Inland Waters, Burlington (Ontario).
P. V. Hodson, B. R. Blunt, and D. J. Spry.
Water Research, Vol. 12, p. 869-878, 1978. 7 fig, 3 tab, 30 ref.

Descriptors: *Lead, *Toxicity, *Rainbow trout, Heavy metals, Iron, Amino acids, Proteins, Biochemistry, Fish physiology, Animal metabolism, Enzymes, Water chemistry, Mortality, Lake Ontario, Fish diets, Path of pollutants, Tissue analysis, Bioaccumulation, Hemoglobin, Mutagens.

Rainbow trout exposed to lead in Lake Ontario water demonstrated a 21-day LC50 of 2.4 mg 1-1 lead. Highest concentrations occurred in opercular bone followed by gill and kidney. Lead accumulation by brain was not clearly demonstrated. Exposure to lead in water at concentrations as low as 13 microg 1-1 caused significant increases in red blood cell (RBC) numbers, decreases in RBC volumes, decreases in RBC cellular iron content and decreases in RBC delta-amino levulinic acid dehydratase activity. No changes were observed in hematocrit or whole blood iron content. The changes indicated increased erythropoiesis to compensate for inhibition of hemoglobin production and increased mortality of mature red blood cells. Lead content of fish exposed to dietary lead was not elevated above control levels and the majority of lead consumed could be accounted for in the feces. Dietary lead may have slightly inhibited uptake of dietary iron. (EIS-Deal)

EFFECTS OF HOLDING TEMPERATURES ON REPRODUCTIVE DEVELOPMENT IN ADULT SOCKEYE SALMON (ONCORHYNCHUS NERKA),
Corvallis Environmental Research Lab., OR.
G. R. Bouck, G. A. Chapman, P. W. Schneider, and D. G. Stevens.
In: 26th Annual Northwest Fish Culture Conference, Dec. 3-5, 1975, Otter Rock, Oregon, p 24-40. 9 tab, 3 fig, 6 ref.

Descriptors: *Aquiculture, *Sockeye salmon, *Bioassay, Laboratory tests, Columbia River, *Water temperature, Mortality, *Thermal pollution, Thermal stress, Water pollution effects, Growth, Fish disease, Bacteria, Fish eggs, Fish physiology, Fish reproduction.

Wild adult sockeye salmon (Oncorhynchus nerka) were captured and placed into tanks supplied with Colmubia River water so that the effects of four temperature treatments could be determined. Treatment included an initial acclimation period wherein temperatures changed about 2C per day until they reached test temperatures of 10, 16.5, 20 and 22C on day eight, and remained there until day 32 when cooling to 10C began. All surviving fish were sacrificed and examined on day 44. The results indicate that 22C was rapidly and directly lethal to all of the fish and while equally lethal, 20C resulted in complete mortality more slowly by infection rather than thermal death. Comparisons of fish surviving the 10C and 16.5C treatment revealed that 10C was associated with less frequent ventilaton of the gills, smaller livers, larger gonads, less geriatrophy and both a lower incidence and a lower antibody titer against Columnaris disease. The authors conclude that 10C would be more favorable for sexually maturing adult sockeye salmon than 16.5C. (EIS-Katz)

BASIC ASPECTS OF THE ANTHROPOGENIC TRANSFORMATION OF LAKE ECOSYSTEMS OF THE NORTHWEST OF THE EUROPEAN PART OF THE USSR,
Akademiya Nauk SSSR, Leningrad. Inst. of Lake Management.
I. I. Nikolayev.
Hydrobiological Journal, Vol 13 (2), 1977, p 1-7. 40 ref. (translated from Russian).

Descriptors: *Lakes, Ecology, *Piscicides, Fish conservation, *Fish control agents, *Fish harvest, Nutrients, Fertilization, Fertilizers, Reservoirs, Hydroelectric power, *Reservoir fisheries, Reservoir operators, Reservoir stages, Water level, Irrigation requirements, Thermal effluents, Thermal effects, Aquatic plants.

Literature data and investigative results are used to analyze the main consequences of anthropogenic action on lake ecosystems. Examples are given of the complete reconstruction of the ecosystems of small lakes by using ichthyccides and subsequent stocking of the water bodies with the valuable ichthyfauna of ponds and the introduction of fertilizers. In the case of large lakes, the consequences of converting them into powerplant reservoirs and the variations in level connected with this are analyzed. In the case of medium-sized lakes, the effects of reducing the water level by using the water for irrigation are determined. The effects of the warm power-plant effluents on aquatic organisms are described. Examples of transplantation of ichthyofauna, invertebrates, and aquatic plants are given, and role of random factors is described. (EIS-Katz)

SOME PATTERNS OF CHANGE IN LACUSTRINE ECOSYSTEMS UNDER ANTHROPOGENIC INFLUENCE,
Polish Academy of Sciences, Warsaw. Inst. of Ecology.
Z. Kajak.
Hydrobiological Journal, Vol. 13 (2), 1977, p. 8-16. 6 tab, 4 fig, 22 ref. (translated from Russian).

Descriptors: *Eutrophication, Nutrients, Water pollution effects, *Zooplankton, *Benthos, Polychaetes, Tubificid worms, *Water temperature, Freshwater fish, Carnivores, Phytoplankton, Biomass, *Mazurian lakes, Poland, Fertilizers, Primary production, Carp, Hypophthalmichthys.

Very rapid eutrophication of the Mazurian lakes has been noted. Under the influence of the influx of biogenic substances, a dystrophic lake was turned into a eutrophic one, while signs of degradation made their appearance in the polytrophic lake. Data were obtained on the feeding of the dominant plankton and benthos species (Dreissena, tubificid worms) and their role in the ecosystem. The production and production efficiency at the individual trophic levels were determined in different lakes, and the energy flow in the lake ecosystem was assessed. It was proved that warming the water improved its self-purification in four of the lakes studied, but was detrimental in the polluted river. Transplantation of Hypophthalmichthys molitrix into a lake produced a drastic decrease in the plankton, completely changed the biocoenosis and the purification function of the lakes. (EIS-Katz)

THE OXIDATION OF PETROLEUM HYDROCARBONS BY MARINE BACTERIA,
State Oceanographic Inst., Moscow (USSR).
A. B. Tayban, A. N. Zubakina, S. P. Barinova, and I. M. Mikhaleva.

Descriptors: Oil, *Oil pollution, *Bacteria, Oil spills, *Decomposing organic matter, *Oxidation, Petroleum hydrocarbons, *Marine bacteria, Alkanes, *Daily degradation rates, Arctic bacteria, Caspian Seas, Microbial degradation rates, Diesel oil.

The results of experiments designed to estimate the rate of the microbial oxidation of oil and hydrocarbons and to study the specific response of test cultures to individual n-alkanes are presented. It was proved that the degree of oxidation of oil and hydrocarbons by the individual cultures of marine bacteria and a mixed bacterial population isolated from the Caspian Sea and from the river Lena ranges from 20 to 98%; the n-alkanes were utilized most intensively. The daily degradation rate of hydrocarbons ranged from 20 to 470 mg/liter (at 20 to 25C). Arctic cultures assimilated the n-alkanes C16-C24 most actively, while the Caspian ones showed a preference for the lighter (C10, C12 and C14) hydrocarbons. (EIS-Katz)

TOXICITY OF CARBOFURAN TO BLUE-GREEN ALGA NOSTOX MUSCORUM,
Central Rice Research Inst., Cuttrack (India). Lab. of Blue-Green Algae.
S. Kar, and P. K. Singh.
Bulletin of Environmental Contamination and Toxicology, Vol 20, p 707-714, 1978. 2 fig, 2 tab, 13 ref.

Descriptors: *Cyanophyta, *Pesticide toxicity, *Biodegradation, *Toxicity, Pesticides, Growth

rates, Nitrogen fixation, Metabolism, Photosynthesis, Chlorophyll, Tolerance, Optical properties, Cytological studies, *Furadan, *Carbofuran, *Nostoc.

The effects of commercial grade pesticide furadan (3% a.i. as carbofuran) on the survival, growth and nitrogen fixation of blue-green algae was studied. The lower concentration of furadan (25 microg/ml) enhanced survival, growth and nitrogen fixation in the alga whereas these were gradually inhibited in higher concentrations (50-1000 microg/ml). The presence of more than 1200 microg/ml was algicidal. Preliminary observations revealed that the pesticide is biodegraded by the alga. (EIS-Deal)

BIOCONCENTRATION RATIO OF DIAZINON BY FRESHWATER FISH AND SNAIL,
National Inst. of Agricultural Sciences, Tokyo (Japan).
J. Kanazawa.
Bulletin of Environmental Contamination and Toxicology, Vol 20, p 613-617, 1978. 1 fig, 2 tab, 4 ref.

Descriptors: *Diazinon, *Pesticide kinetics, *Pesticide residues, Path of pollutants, Organophosphorus pesticides, Carp, Crayfish, Snails, Fish physiology, Animal physiology, Animal metabolism, Enzymes, Bioconcentration, Tissue analysis, *Grudgeon, Guppy, Diazinon.

The bioconcentration ratios of diazinon from water by freshwater fishes were generally larger than that of crayfish and snails. Among fishes, the bioconcentration ratio of diazinon by topmouth grudgeon was the highest. However, elimination of diazinon from fish was linearly rapid. The influence of test concentration on the bioconcentration ratio was not considerable. The bioconcentration ratio of diazinon in whole body of topmouth grudgeon increased proportional to the body weight. (EIS-Deal)

RESPIRATION, GROWTH AND FOOD CONVERSION EFFICIENCY OF PINFISH (LAGODON RHOMBOIDES) EXPOSED TO SUBLETHAL CONCENTRATIONS OF BLEACHED KRAFT MILL EFFLUENT,
Florida State Univ., Tallahassee. Dept. of Biological Science.
A. W. Stoner, and R. J. Livingston.
Environmental Pollution, Vol 17, p 207-217, 1978. 2 tab, 33 ref.

Descriptors: *Pulp wastes, *Toxicity, Fish physiology, *Respiration, *Growth rates, Animal metabolism, Biochemistry, Lipids, Proteins, Digestion, Effluents, Animal pathology, Fish diseases, Fish behavior, Pulp and paper industry, *Pinfish, Lagodon, Tissue analysis.

Young pinfish were exposed to 0.01%, 0.10% and 1.00% concentrations of neutralised bleached kraft mill effluent (BKME) for 28 days. Fish exposed to 1.00% BKME demonstrated elevated gill ventilation rates and were characterized by reduced total lipid content, reduced condition factor, increased moisture, and increased protein content when compared with controls. Control fish converted 44.6% of the ration to wet weight. Wet food conversions of pinfish exposed to 0.10% and 1.00% BKME were reduced by 47.8% and 73.5%. No respiratory, biochemical or food conversion differences were found between controls and fish exposed to 0.01% BKME. Differences were significant in concentrations of BKME less than 1.0% of the lethal concentration. (EIS-Deal)

SOME FEATURES OF ION EXCHANGE IN FISH DURING THEIR ADAPTATION TO A HIGHER CO2 CONTEST IN THE WATER,
Akademiya Nauk URSR, Kiev. Inst. Hidrobiologii.
V. D. Romanenko, and V. A. Krisal'nyy.
Hydrobiological Journal, Vol 13 (2), 1977, p 73-76, 2 fig, 8 ref. (translated from Russian).

Descriptors: *Freshwater fish, *Fish physiology, Biochemistry, *Carbon dioxide, Ion exchange, Ion transport, Fish diseases, Acidity, Oxygen, Bicarbonate, Water quality, *Carp, Bicarbonate buffer system, Water pollution effects.

It was shown in chronic tests on carp that exposure in water with high (0.4, 0.8 and 1.1 mM/liter) content of free carbon dioxide produces changes in the bicarbonate buffer system of the blood, as well as sharp shifts in ion exchange. The content of bicarbonates, sodium and potassium in blood plasma increased so as to prevent carbon dioxide acedemia. In the complicated process of regulating homeostasis in fishes, an important place belongs to the redistribution of ions between the tissues and blood plasms. (EIS-Katz)

The anionic detergent sodium lauryl sulfate disrupts the metabolic processes in the new Black Sea arrival of M. arenaria, in particular changing the content of total and individual sterols. An 0.01% dose of the detergent at an exposure of three days proved highly toxic to the mollusks which was reflected in the death of some individuals. (EIS-Katz)

D. Waste Treatment Processes

VALUATION AND COMPARISON OF OVER-AND FLOW AND SLOW RATE SYSTEMS TO PGRADE SECONDARY WASTEWATER AGOON EFFLUENT,
ah State Univ., Logan. Coll. of Engineering.
. C. Kemp, D. S. Filip, and D. B. George.
vailable from the National Technical Information Service, Springfield, VA 22161 as PB-291 726, Price codes: A04 in paper copy, A01 in microfiche. Utah Water Research Laboratory, Logan Water Quality Series UWRL/Q-78/02, December 1978. 60 p, 58 fig, 42 tab, 2 append. OWRT A-034-UTAH(1). 14-34-0001-8047.

Descriptors: *Sewage treatment, *Overland flow, Irrigation, Lagoons, Oxidation lagoons, Waste water treatment, Waste disposal, *Slow rate systems, Tertiary treatment.

To evaluate the effectiveness of overland flow treatment in upgrading secondary wastewater lagoon effluent, three 15 x 36 m plots on a 2.5 percent slope were constructed and sown for a high density vegetative cover using Reed Canary grass. Wastewater was applied to the upper end of each plot at rates of 7.5, 15, and 22.5 cm/week. Results from the overland flow system investigation were compared with similar data obtained the preceding year from an existing slow rate land application system on an adjacent site. Secondary effluent from the same lagoon system was applied to the slow rate system study area. After evaluating influent and effluent water quality characteristics from both systems, site specific efficiencies were detailed. Overland flow as a tertiary treatment process may not be suitable to satisfy future discharge standards because of the minimum biochemical oxygen demand and suspended solids effluent concentrations that are attainable. Overland flow could be used as a nitrification-denitrification process if land costs were sufficiently low. The slow rate system can be an excellent tertiary treatment method if the groundwater is protected and no subsurface water collection and discharge is required. If a discharge is required, organic carbon and nutrient concentrations might be unacceptable depending upon initial site soil conditions.

FEDERAL GUIDELINES, STATE AND LOCAL PRETREATMENT PROGRAMS, VOLUME III, APPENDIX 8,
Environmental Protection Agency, Washington, DC. Municipal Construction Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 783, Price codes: A18 in paper copy, A01 in microfiche. Report No. EPA-430/9-76-017c, January 1977. 409 p, 87 fig, 80 tab, 63 ref.

Descriptors: *Pre-treatment(Water), Waste water, *Industrial wastes, *Waste water treatment, Neutralization, Sedimentation, Filtration, Effluents, Liquid wastes, Treatment facilities, Publications, Pollutants, Adsorption, Activated carbon, Separation techniques, Treatment facilities, Public utilities, Sewerage.

Data concerning the major industries potentially contributing waste water to publicly owned sewer systems and treatment works are presented. Thirty-four major industrial categories, partially established by the Federal Water Pollution Control Act Amendments of 1972 (PL 92-500), are summarized according to the: (1) a general industry description of the products, raw materials, and waste characteristics; (2) the categorization and subcategorization developed by the EPA in the effluent guidelines program; (3) process descriptions; (4) waste characterization; and (5) control and treatment technology with in-plant controls and end-of-pipe treatment used. Pretreatment is generally required by EPA, states, and municipalities to prevent pollutants from being discharged through municipal systems. Pretreatment considerations involve assessment of individual plant effluents, in-plant control methods, recycle opportunities, water conservation and reuse possibilities. Such considerations may differ depending on whether or not the pollutants to be controlled are susceptible to treatment in a Publicly Owned Treatment Works (POTWS). Pretreatment for compatible and incompatible pollutants may take a variety of forms including coarse solids separation, grit removal, equalization, neutralization, dissolved air flotation, sedimentation, filtration, biological treatment, physical-chemical treatment, chemical precipitation and coagulation, activated carbon adsorption, and chemical conversion. A STUDY OF WASTE GENERATION, TREATMENT AND DISPOSAL IN THE METALS MINING INDUSTRY,
Midwest Research Inst., Kansas City, MO.
D. Bendersky, R. E. Gustafson, C. E. Mumma, K. R. Walker, and D. Costello.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 052, Price codes: A18 in paper copy, A01 in microfiche. Final Report No. SW-132c, October 1976. 406 p, 37 fig, 120 tab, 308 ref, 4 append.

Descriptors: *Waste disposal, *Mine wastes, *Metals, *Waste treatment, *Landfills, Tailings, Overburden, Waste rock, Copper, Lead, Zinc, Chromium, Cadmium, Antimony, Mercury, Uranium, Vanadium, Selenium, Asbestos, Arsenic, Beryllium, Waste identification, Cost analysis, Hazards.

The purpose of this study was to provide the Environmental Protection Agency with a data base regarding the current and projected types and quantities of the potentially hazardous wastes generated by the metals mining and concentrating industry, applicable treatment, and disposal technologies and their costs. According to the contract, specific attention was to be given to wastes containing asbestos, arsenic, lead, mercury, halogenated hydrocarbons, pesticides, selenium, and zinc. Other potential hazards included were carcinogens, chromium, and cadmium. The industry generated a total of 2,365 million tons of waste during 1974 consisting of waste rock, overburden, dry concentration wastes, and wet wastes. The largest amount of these wastes was produced by the copper industry with uranium-vanadium, lead-zinc, mercury, and miscellaneous ores following in that order. Overburden and waste rock, except for uranium ore waste rock, do not add to the potential hazards of the disposal site they occupy because their hazardous content is about the same as the site. Concentration process wastes, fine grained and subject to wind and water erosion, may contain potentially hazardous concentrations higher than their disposal site. Potentially hazardous substances have been identified in the land disposed wastes of the following: copper ore tailings, lead-zinc tailings, uranium ore waste rock, uranium ore tailings, antimony ore tailings, and beryllium ore tailings. Adequate waste treatment and land disposal methods are available to companies mining and concentrating copper, lead-zinc, zinc, mercury, and miscellaneous metals ores. Costs of waste disposal vary depending on the type of ore, mining method, and quantity of waste. (Davison-IPA)

MUNICIPAL SLUDGE MANAGEMENT: EPA CONSTRUCTION GRANTS PROGRAM, AN OVERVIEW OF THE SLUDGE MANAGEMENT SITUATION,
Environmental Protection Agency, Washington, DC. Municipal Construction Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 695, Price codes: A04 in paper copy, A01 in microfiche. Report Nos. EPA-430/9-76-009, and MCD-30, April 1976. 67 p, 1 fig, 22 tab, 7 append.

Descriptors: *Waste treatment, *Sewage sludge, *Treatment facilities, *Sludge disposal, *Municipal wastes, Ocean disposal, Incineration, Landfills, Lagoons, Cities, Communities, Regional analysis, Capital costs, Maintenance costs, Operating costs, Environmental effects, Water Pollution Control Act, Sewage lagoons, Sewage disposal, Sewage ponds, Cost analysis.

A summary of information available on municipal sewer sludge production and alternatives for the disposal/utilization of municipal sewer sludge is presented. The major cities are the key problem areas of sludge disposal. Many are phasing out current ocean disposal, and have problems obtaining sites and approval of sludge management alter-

natives. Of the 22,000 municipal treatment plants, over 5,000 are waste water treatment ponds having few disposal problems. Fewer than 350 of the remaining 17,000 plants are larger than 10 MGD; 65% of the nation's plants are estimated at less than 1 MGD in design flow. Current methods of municipal sewage sludge disposal are estimated as follows: ocean disposal, 15%; incineration, 35%; landfill, 25%; and land applications, 25%. Not included in these estimates are the operations storing sludge in lagoons with no future disposal method planned. Sludge disposal practices vary within the states as well as within the regions, i.e., communities in the Midwest apply sludge to the land, the major inland cities use landfills and incineration, and only areas near the ocean utilize ocean disposal. Capital costs and operation and management costs, dependent upon such variables as energy, transportation, land, labor, monitoring requirements, and environmental regulations, vary greatly for the several sludge management alternatives. It is estimated that 30 to 50% of a conventional treatment plant's capital costs go for sludge management treatment and that more than $400 million/year are required for operation and management costs. (Davison-IPA)

WASTEWATER TREATMENT TECHNOLOGY DOCUMENTATION, FORMULATION OF ALDRIN/DIELDRIN, DDT, ENDRIN, TOXAPHENE,
Midwest Research Inst., Kansas City, MO.
A. F. Meiners, C. E. Mumma, T. L. Ferguson, and G. L. Kelso.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-254 017, Price codes: A07 in paper copy, A01 in microfiche. Report Nos. EPA-440/9-76-015 and MRI-41227-C, June 1976. 124 p, 12 fig, 4 tab, 33 ref, 3 append. 68-01-3524.

Descriptors: *Industrial wastes, *Pesticides, *Waste water treatment, Technology, Aldrin, Dieldrin, Endrin, Toxaphane, Water use, Evaporation, Sewers, Landfills, Activated carbon, Adsorption, Incineration, Rain water, Economics, Capital cost, Operating costs, Models, Toxicity, Water pollution sources, Surface runoff, Cost comparison, Cost analysis, Water conservation, Waste water disposal.

Waste water management and associated costs at plants manufacturing aldrin/dieldrin, DDT, endrin, and toxaphene are examined. The entire pesticide formulation industry is characterized with regard to its waste water treatment technology, waste water management costs, the usage of water, and the source of waste water in these plants. Inplant control technology for eliminating the use of water and minimizing contamination of waste water discussed. Current and former practices such as evaporation systems, sewer systems, landfills, contract disposal, activated carbon adsorption, incineration are described. Methods for managing process waste water intended to achieve zero discharge of the cited pesticides include: elimination of process water, evaporation systems and contract disposal. Methods for managing rainwater runoff directed at achieving zero discharge include covering all formulation operations, removing or paving over contaminated soils, and diversion of 'clean' runoff. Estimates of capital investment and annual operating costs are made on the basis of model plants developed using the technology aimed at zero discharge of the designated pollutants. (Davison-IPA)

WASTEWATER TREATMENT TECHNOLOGY DOCUMENTATION FOR ENDRIN MANUFACTURE,
Midwest Research Inst., Kansas City, MO.
A. F. Meiners, C. E. Mumma, T. L. Ferguson, and G. L. Kelso.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-254 015, Price codes: A06 in paper copy, A01 in microfiche. Final Report No. EPA-440/9-76-011, February 6, 1976. 100 p, 5 fig, 7 tab, 39 ref, 1 append. 4127-C, 68-01-3524.

Descriptors: *Waste water treatment, *Endrin, *Organic pesticides, *Halogenated pesticides, *Industrial wastes, Activated carbon, Sedimentation, Filtration, Neutralization, Adsorption, Resins, Degradation, Capital costs, Direct costs, Indirect costs, Pilot plants, Velsicol Chemical Corporation, Cost analysis, Cost comparisons.

The treatment of waste water resulting from the production of endrin, a stereo-isomer of dieldorin, by the Velsicol Chemical Corporation, the sole U.S. manufacturer of endrin, is examined. Plant capacity and production rate data were not available, but production for 1975 was estimated at 6 million pounds of endrin. Total waste water discharge from the plant averaged 3,514 gpm and contained an average of 2.5 lb of endrin/day in May 1975. Both process waste waters and cooling waters are contaminated with endrin. The current (1975) waste water treatment system consists of sedimentation, sand filtration, fine cartridge filtration, and neutralization. After treatment, the waste waters are discharged into the municipal sewer system. Four waste water treatment systems potentially effective in reducing the concentration of endrin and the daily load are examined in detail. The four systems are: resin adsorption, reductive degradation, resin adsorption and reductive degradation in series, and activated carbon adsorption. These systems are feasible according to laboratory experiments, and the first three are under laboratory pilot plant study at the site. The technology for the activated carbon system is available in other industries and is most likely transferable to endrin use. Waste water treatment cost estimates for these systems include capital investment costs, direct costs, and indirect costs. (Davison-IPA)

WASTEWATER TREATMENT IN COLD CLIMATES,
Army Terrestrial Sciences Center, Hanover, NH.
R. S. Sletten, and A. Uiga.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-026 156, Price codes: A02 in paper copy, A01 in microfiche. 1976. 15 p, 5 fig, 6 tab, 15 ref.

Descriptors: *Waste water treatment, *Alaska, *Treatment facilities, Aerated lagoons, Aeration, Arctic, Federal Water Pollution Control Act, Military reservations, Filtration, Ponding, Land management, Personnel, Weather.

Waste water treatment systems in use at remote military installations in Alaska are described, and techniques for upgrading these systems to meet EPA's secondary effluent criteria are discussed. Existing systems primarily use aerated lagoons and extended aeration package plants, and indications are that most of these systems could not meet EPA's secondary effluent criteria. Due to the remote, isolated nature of most of the camps, it is suggested that upgrading processes be as simple as possible to design, build and operate. Potentially feasible techniques include land application, intermittent filtration, and variations of ponding, although no one solution can be recommended for every situation because of the limiting factors of land availability for ponding and availability of suitable soils for land application or intermittent filters. To ensure effective waste water treatment in the Arctic, long range requirements include the availability of trained treatment plant operators and research into methods to make arctic weather as asset rather than a liability. THE EFFECTS OF UV LIGHT ON TNT AND OTHER EXPLOSIVES IN AQUEOUS SOLUTION,
Naval Weapons Support Center, Crane, IN. Weapons Quality Engineering Center.
C. C. Andrews, and J. L. Osmon.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-036 132, Price codes: A04 in paper copy, A01 in microfiche. Report No WQEC/C-77-32, January 12, 1977. 65 p, 8 fig, 12 tab, 7 ref, 3 append.

Descriptors: *Waste water treatment, *Explosiv *Ultraviolet radiation, *Peroxide, Acetone, Org ic compounds, Chemical wastes, Effluents, Po tion abatement, Water pollution sources, Nitro compounds, Laboratory tests, Cyanide, Ammo

Four bench-scale ultraviolet (UV) light syst used in treating water contaminated with explo compounds were studied. The use of acetone hydrogen peroxide with the UV light are viewed. Small concentrations (0.1%) of hydro peroxide used with UV light yielded the best tr ment for removing TNT, Explosive D, cyclo (RDX), homocyclonite (HMX), 2, 4 DNT (dini toluene), and 2, 6 DNT from contaminated s tions. Each compound was eliminated within hour or less of hydrogen peroxide exposure decrease of their TOC load was observed. O negligible amounts, 10 to 50 ppb, of trinitroben were present after one hour of exposure, an appeared that the organic material was destroy The use of acetone in the UV continuous f system prototyped the UV-peroxide system, bu success was questionable because of its volati and flammability, and because it contributed un sirable qualities to the solution through TOC c centration. It was established that the static syst was more efficient than the continuous f system, but the flow rate must be regulated allow sufficient constant exposure for best resu During the study peroxide was introduced to explosive solution just before treatment. Dur the study peroxide was introduced to the explo solution just before treatment. However, the a tion of small increments on a continuous basis result in greater efficiency with less perox waste. (Davison-IPA)

OZONIZATION OF WATER CONTAIN HUMIC COMPOUNDS, PHENOLS, AND P TICIDES (OZONIROVANIYE VODY, SODE HASHCHEY GUMINOVYE SOYEDINENI FENOLY I PESTITSIDY),
R. D. Gabovich, and I. L. Kurennoy.
Available from the National Technical Informat Service, Springfield, VA 22161 as ADA-038 4 Price codes: A02 in paper copy, A01 in microfic Voprosy Kommunalnoy Gigiyeny, No 6, p 11- 1966. Translated by Army Medical Intelligen and Information Agency, Washington, D.C. Tra lation No USAMIIA-K-4564.

Descriptors: *Ozone, *Water purification, *Chl ination, *Pesticides, *Color reactions, Water an sis, Phenols, Water quality, Sewage treatment, ganic matter, Decomposing organic matter, Hu acids, Degredation, Water pollution treatm Waste water treatment, Water quality, Odor.

Conditions affecting the use of ozone to br down mixtures of humic substances and decolo water, and the use of ozone for breaking do phenols and some pesticides in distilled water s tions and humic solutions were studied. The a tion of ozone to water breaks down humic s stances and the color they impart to the water. amount of ozone required to decolorize the w varied depending on the degree of water chro ticity. The amount of ozone required to dephe lize water was from 0.75 to 2.5 milligrams of oz per milligram of phenol depending on the deg of purification. The effects of ozone on the pe cides, malathion, methylparathion, wofatox, tri lorometaphos, preparation M-81, and dintroort cresol, in distilled water with color added, w studied. It was found that in the deodorization water containing only toxic chemicals, oz worked best in some cases, and chlorine wor best in others. Humic compounds in natural wa did not prevent deodorization, but might req more ozone because decolorization occurs at same time as pesticide breakdown. It is conclu that ozonization and chlorination can be used disinfect sewage containing large amounts of pe cides. (Davison-IPA)

closed, recycled-water sanitary-waste-disposal tem for laboratory study was developed. The tem was based on a 1,000-liter capacity, water- ed biodegradation tank. Two specific environ- ntal variables were studied: organic-loading rate an artificial waste material, based on ground g-food into the system, and aeration rates im- ed on the water column. Two loading rates (2 l 3 persons/day equivalent of sanitary wastes) l two aeration rates (6 and 12 liters/minute) re imposed on the experimental system. Sam- ng of the tank was carried out on a weekly edule by sample withdrawal from ports pene- ting the tank walls. Data were collected and alyzed for the following biological and chemical rameters: total aerobic and anaerobic standard te counts, ATP content, total carbon, inorganic rbon, organic carbon, pH, and dissolved oxygen. addition, the predominant bacterial genera pres- during the stationary stages of the experimental ns were isolated and identified. Data response rves were created to follow the effects on the above parameters of the various regimes of loading and aeration during the relatively longterm (about 130 days) experimental runs.

ANALYSIS OF DIFFERENCES IN MUNICIPAL TREATMENT LEVELS,
Environmental Protection Agency, Washington, DC. Office of Analysis and Evaluation.
J. V. Yance.
Water Resources Research, Vol 14, No 6, p 993-1002, December 1978. 2 fig, 3 tab, 28 ref.

Descriptors: *Waste water(Pollution), *Regression analysis, *Treatment levels, Treatment facilities, Economics, Effects, Programs, Investment, United States, Equations, Costs, Assimilative capacity, Urban development, Systems analysis, Cities.

Effluent charges are often proposed as the best way to insure that environmental costs will be internalized by the discharger. However, even in the absence of such charges, municipal treatment plants have been constructed for many years, an indication that to a significant degree, states and communities have internalized the pollution costs of waste water discharges. The motivation for such investments varies widely, however, since before secondary treatment became a Federal requirement, the percentage of the sewered population in a state receiving such treatment ranged from 9 in New Hampshire to 100 in New Mexico. Using regression techniques, this analysis explains 40-45% of the variation in treatment levels among states in 1968 in terms of factors such as the availability of assimilative capacity relative to waste loads and the recency of urban development. The results of state and local programs appear to have been rational, broadly speaking, more extensive treatment being applied where pollution impacts would be greater. Some of the economic implications of the construction grant program, which provides an added incentive for treatment plant investment, are discussed in the light of these results. (Bell-Cornell)

SERIES INTERMITTENT SAND FILTRATION OF WASTEWATER LAGOON EFFLUENTS,
Utah State Univ., Logan.
D. W. Hill, J. H. Reynolds, D. S. Filip, and E. J. Middlebrooks.
Report PRWR153-1, Utah Water Reseach Laboratory, College of Engineering, Utah State University, Logan, Utah, March 1977. 89p, 12 fig, 56 tab, 87 ref, 2 appen.

Descriptors: *Sands, Filtration, *Wastewater(Pollution), *Lagoons, *Effluents, Water quality, Standards, Treatment facilities, Equations, Design criteria, Economic analysis, Loading rates.

Previous researchers have found single stage intermittent sand filtration to be a feasible and economic means of upgrading wastewater lagoon effluent to meet future standards. However, the major constraint on their use has been the length of the filter runs. Laboratory scale and pilot-scale series intermittent sand filtration of wastewater lagoon effluents has been found to substantially increase the length of the filter runs as well as produce a high quality effluent able to meet future standards. Higher loading rates were found to be possible with series intermittent sand filtration. The operation consistently produced an effluent meeting present Utah 'Class C' water quality standards for BOD, (greater than or equal to 5 mg/1), and the operation also consistently met the 1980 Utah wastewater treatment plant effluent standard for suspended solids (greater than or equal to 10 mg/1). CONCENTRATION EFFECTS ON SEPARATION SELECTIVITY IN FOAM FRACTIONATION,
Polytechnic Inst. of New York, Brooklyn. Dept. of Chemistry.
E. J. Chou, and Y. Okamoto.
Seperation Science and Technology, Vol. 13, No. 5, p 439-448, 1978. 4 fig, 3 tab, 16 ref.

Descriptors: *Surfactants, *Chelation, *Metals, *Foam fractionation, *Competition, Cadmium, Nickel, Foam separation, Ions, Spectrophotometry, Tensiometers, Surface tension, Waste water treatment, Industrial wastes.

A polyalkylenepolyamine was employed as a chelating surfactant for foam fractionation of metallic ions from aquenous solutions. When 4-dodecyldiethylenetriamine was used as the chelating surfactant, selective removal of Cd(+2), Ni(+2), and Cu(+2) form aquenous solution was a function of the metal and surfactant concentrations. A deionized metal-bearing solution with an adjusted pH was mixed with the surfactant in a separation unit; water-saturated compressed air was bubbled through the solution. Metal concentraions in the foamate and residue were measured by atomic absorption spectrophotometry; surface tensions were calculated with a tensiometer. When the surfactant concentration exceeded the total metallic ion concentration in solution, Ni(+2) complexed with the surfactant more readily than Cu(+2), indicating that Ni(+2) was selectively removed during foaming. The reverse was found true when the metallic ion concentration was increased. Cu(+2) completed more readily for surfactant complex formation; bubbles enhanced Cu(+2) removal. Ni(+2) and Cd(+2) were no as readily removed under higher ionic conentrations. In solutions containing Cd(+2), Cu(+2), and Ni(+2) with higher total concentrations that the chelating agent, the order of selective removal was Cu(+2) > Ni(+2) > Cd(+2). When the surfactant concentration increased, the removal order was reversed to Cd(+2) > Ni(+2) > Cu(+2). (Lisk-FIRL)

THE EFFECT OF TEMPERATURE CONTROL ON BIOLOGICAL WASTEWATER TREATMENT PROCESSES,
Purdue Univ., Lafayette, IN. School of Mechanical Engineering.
C. E. Collins, F. P. Incropera, and C. P. Grady, Jr.
Water Research 1978, Vol. 12, p. 547-554, 9 fig, 33 ref. OWRT A-042-IND (5).

Descriptors: *Waste water treatment, *Biological treatment, *Temperature, Activated sludge, *Waste treatment, Sludge treatment, Mathematical model, Solids retention time.

A model has been developed to simulate the effect of temperature control on the performance of a completely mixed activated sludge wastewater treatment system. From calculations based on the model it is demonstrated that effluent quality is significantly improved for any increase in temperature from 10 degrees to 30 degrees C, irrespective of solids retention time (SRT) and sludge settling characteristics. A trade-off exists conerning the effects of temperature on the sludge disposal and oxygen requirements of the system. Although any increase in temperature above 20 degrees C will significantly reduce the sludge production rate, it will also contribute to increased air flow power requirements. The results suggest that a suitable compromise may be reached with a temperature between 23 and 27 degrees C and an SRT between 8 and 14 days.

KINETICS OF WET OXIDATION OF NYLON 66,
Connecticut Univ., Storrs. Dept. of Chemical Engineering.
D. W. Sundstrom, A. J. Luciano, and H. E. Klei.
Journal of Applied Polymer Science, Vol. 20, p 207-216, 1976. 7 fig, 9 ref. OWRT A-019-CONN(3), OWRT 14-01-0001-1075.

Descriptors: *Waste disposal, *Oxidation, *Polymers, *Degradation(Decomposition), Activation energy, Temperature, Mass transfer, *Polymer waste degradation, *Aqueous phase oxidation,

*Wet oxidation, *Nylon 66, *Reaction kinetics, *Rotating disc geometry, Dissolved oxygen concentration.

The kinetics of the aqueous phase oxidation of nylon 66 was studied at temperatures up to 190C. The nylon 66, in the form of a cylindrical disc, was attached to the shaft of a variable-speed drive inside the reactor. With a rotating disc geometry, the chemical kinetics of the surface reaction can be separated from the mass transfer effects. By measuring the reaction rates at different temperatures, pressures and disc rotational speeds, a kinetic rate expression was developed relating nylon degradation to dissolved oxygen concentration and temperature. The order of reaction with respect to dissolved oxygen concentration was 0.6, and the activation energy was 42 kcal/g-mole. (de Lara-Conn)

NUTRIENT REMOVAL FROM SECONDARY EFFLUENT,
Nova Scotia Technical Coll., Halifax. Dept. of Bio-Resources Engineering.
K. V. Lo, and J. T. Clayton.
Canadian Agricultural Engineering, Vol. 20, No. 1, June 1978. p 64-69. 3 fig, 8 tab, 7 ref.

Descriptors: *Nutrient removal, *Soils, *Land treatment, *Land application, *Waste water treatment, *Phosphates, *Nitrogen, *Denitrification, *Water purification, Effluents, Ammonia, Hydrogen ion concentration, Soil contamination, Ninigrit sandy load, Hinckley sand, Canada, Water quality standards, Soil columns, Absorption, Water reuse, Potable water.

Soil columns of Ninigrit sandy loam and Hinckley sand were used to study effects of effluent application rate and frequency on wastewater renovation through soil media. Attempts were also made to determine nutrient absorptive properties of Ninigrit sandy loam; under eqilibrium batch conditions, ammonia absorption on the soil can be expressed by the Freundlich absorption isotherm. In pH ranges common to wastewaters (about 7.0) nitrate absorption on the soil was insignificant. Column test resuls showed that all soil columns removed 99% or more phosphate; phosphate from the secondary effluent applied accumulated in the top 2.5-5.0 cm of the soil columns, depending on loading. At the end of the 12-week test period, nitrogen concentrations in all filtrates achieved the Canadian drinking water standard of 10 ppm nitrate-nitrogen. Columns with five cm/wk application had the best nitrogen removal, about 80%. Columns with 10 and 20 cm/wk application rates had nitrogen removals ranging 63-74%. If crops were incorporated into the system, nitrogen removal efficiency would probably be higher. Tests results also showed that denitrification could have been significant in nitrogen removal. Total nitrogen loss in the soil columns amounted to about 65-80% of the nitrogen input from wastewater, a portion of which must be due to denitrification. (Lynch-Wisconsin)

RECYCLING ZINC IN VISCOSE RAYON PLANTS BY TWO STAGE PRECIPITATION,
Environmental Protection Agency, Cincinnati, OH. Office of Technology Transfer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 136, Price Codes: A02 in paper copy, A01 in microfiche. Report No. EPA-625/2-73-001a, December 1972. 12 p, 6 fig, 3 tab.

Descriptors: *Waste treatment, *Recycling, *Zinc, Industrial wastes, Water pollution sources, Separation techniques, Neutralization, Cost-benefit analysis, Economics, Viscose rayon industry, Sludge, Textiles, Chemical precipitation.

A method for recovering zinc in rayon process sludge was proven. The recovered zinc, recycled to the rayon manufacturing plant, showed no adverse effects on the rayon yarn. The zinc recovery process involves two stage precipitation with the second precipitation under careful pH control using sodium hydroxide in a circulating slurry of zinc hydroxide crystals. This recovery system enhances the economics of zinc pollution control; allows neutralization of the acid stream; and the recovery of the zinc results in a profit for industrial yarns and a moderate cost for textile yarns. (Davison-IPA).

FEDERAL GUIDELINES: PRETREATMENT OF POLLUTANTS INTRODUCED INTO PUBLICLY OWNED TREATMENT WORKS,
Environmental Protection Agency, Washington, DC. Office of Water Program Operations.
October 1973. 160 p, 45 tab, 94 ref, 4 append.

Descriptors: *Waste water treatment, *Pretreatment(Water), Publications, *Federal Water Pollution Control Act, Industrial wastes, Municipal wastes, Treatment facilities, Effluents, Water pollution treatment, Water pollution control, Pollutant identification, Biochemical oxygen demand, Phosphorus, Phosphorus compounds, Nitrogen, Nitrogen compounds, Legislation, Regulation.

The Federal Water Pollution Control Act Amendments of 1972 (P.L. 92-500) requires the promulgation of guidelines for the pretreatment of waste waters to be discharged to publicly owned treatment works. The relationship between pretreatment and the effluent limitations is distinguished. Information is presented on effluent limitations for National Pollutant Discharge Elimination Systems (NPDES) municipal permit; effluent limitations for publicly owned treatment works; and joint treatment and pretreatment. Basic pretreatment policy considerations for the development of these guidelines include: joint treatment, where it is economical; in-plant measures for reducing the quantity and strength of industrial waste waters; pretreatment to remove compatible pollutants is not required by the Federal standards; and state and municipal pretreatment requirements should be tailored to the specific limitations of the individual treatment works. Federal, state and local pretreatment standards are discussed. Appendix D identifies waste water characteristics and pretreatment unit operations for 22 industrial groups. (Davison-IPA)

Descriptors: *Waste disposal, *Waste treatmen *Recycling, Waste identification, Chemical waste Industrial wastes, Solid wastes, Liquid waste Legal aspects, Financing, Transfer, Informatio exchange, Data collection, Marketing.

An assessment of the feasibility and potenti impact of transferring wastes in the U.S. is repor ed, and guidelines for organizing and operating waste transfer organization are provided. From a investigation of existing European 'waste e changes' it was determined that there are tw types of transfer agents: (1) the informatio clearinghouse which transfers information onl and (2) the materials exchange which accepts res dues, analyzes them, identifies new uses, render necessary treatment, and actively seeks buyer Concepts and requirements for transferring wast are analyzed; a distinction is made between 'tras waste,' which has no reuse value, and 'scra waste,' which can be reused. Quantities of industr al process wastes suitable for transfer are estimate for the Philadelphia Standard Metropolitan Stati tical Area. Industries manufacturing chemicals using chemicals as raw materials produces wast suitable for transfer services. These industry type are: pharmaceuticals; paint and allied product organic and chemicals; petroleum refining; an small industry machinery. Industries with a nee for fuels or cleaning solvents are potential users scrap wastes. The techniques and procedures fo successful transfer of reusable wastes are examine Financial and legal aspects for these organizatio are discussed. (Davison-IPA)

ing.

e development of an Activated Carbon Treat-
nt System (ACTS) for municipal sewage is dis-
sed. Initial work included laboratory testing
research, development of a 10,000 gallon/day
nonstration plant, and pilot plant equipment
s. Procedures involved in the ACTS sewage
eration include: carbon-sewage treatment, pri-
y and secondary clarifiers, gravity (multi-
dia) filter, filter press dewatering, flash drying
carbon-sewage filter cake, and sludge pyrolysis
activation. Construction of the 1 million
lon/day pilot plant at Orange County Sanitation
trict employing this system was expected to be
npleted by February 1976. Preliminary econom-
estimates indicate that this process provides a
ital cost savings up to 25% over competitive
vage treatment in meeting projected ocean dis-
rge standards. (Davison-IPA).

WASTEWATER REUSE BY BIOLOGICAL-CHEMICAL TREATMENT AND GROUND-WATER RECHARGE,
Water Planning for Israel Ltd., Tel-Aviv. Dept. of Sewage Reclamation.
E. Idelovitch.
Journal of the Water Pollution Control Federation, Vol. 50, No. 12, p 2723-2739, December 1978. 10 fig, 4 tab, 33 ref.

Descriptors: *Water reuse, *Groundwater recharge, *Waste water treatment, Water treatment, Groundwater, Recharge, Treatment, Irrigation, Projects, Municipal wastes, Sewage, Water quality, Potable water, Wells, Water wells, *Israel, Nonpotable reuse.

The approach of indirect nonpotable reuse of municipal wastewater, after biological-chemical treatment and groundwater recharge, was adopted in Israel for the Dan Region Project--Stage I. Its implementation involves conversion of the country's southern water supply and nonpotable water, mainly for irrigation. Chemical treatment, consisting of the high lime-magnesium process followed by detention of the effluent in polishing ponds (primarily for ammonia stripping and recarbonation), efficiently removes phosphorus, ammonia and total nitrogen, organics, trace elements including boron and fluorides, and bacteria and viruses from oxidation pond effluent. The removal efficiency of the process is higher in summer than in winter. Groundwater recharge provides for seasonal storage, additional purification of the effluent by a variety of processes taking place in the soil and in the aquifer, and dilution with high-quality natural groundwater. The reclaimed water fulfills the quality requirements of unrestricted crop irrigation and of a wide variety of industrial uses; it also satisfies most of the requirements of prevailing drinking water standards. (Sims-ISWS)
W79-03305

CONTINUOUS SEWAGE SLUDGE HEAT TREATMENT APPARATUS,
G. Nakamura.
U.S. Patent No. 4, 110,217, 5 p, 4 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 973, no 5, p 2312, August 29, 1978.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, Sewage disposal, Sludge treatment, Steam, Heat treatmeent, Eqlipment.

A sewage disposal apparatus is described for continuous heat treatment of sludge delivered from the final settling tank of a sewage disposal system on a large industrial scale. The object of the invention is to treat sludge with steam of relatively low pressure and temperature without requiring a substantially long period of aging. Since the treatment is run continuously it requires a smaller sized vessel. The apparatus has an axially porous member within a vertical vessel and radial apertures in the side wall of the vessel so that almost all of the sludge is exposed to and thus heated with steam supplied through the radial apertures. The sludge is fed into the head of the vessel and falls down in the form of thin strings through axial pores and hits the tail of the vessel. (Sinha - OEIS)

METHOD OF IMPROVING THE BACKWASHING OF FIXED BEDS FORMED OF GRANULAR MATERIALS,
Sulzer Bros. Ltd., Winterthur (Switzerland). (Assignee).
I. Sekoulov, and W. R. Muller.
U.S. Patent No. 4,113,612, 7 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 974, no 2, p 932, September 12, 1978.

Descriptors: *Patents, *Waste water treatment, *Water purification, *Water pollution treatment, Activated carbon, Adsorption, Filtration, Equipment, Gases, *Backwashing.

A method improves the backwashing of fixed beds formed of granular materials and used during waste water purification or water treatment. The fixed bed, during the course of the backwashing is maintained during a predetermined time duration filled with a quiescent liquid. This liquid contains at least one substance which is distributed as uniformly as possible. In the presence of a spontaneous, catalytically triggered decomposition reaction, this substance releases a gaseous component. Then, the fixed bed is backwashed with water. (Sinha - OEIS)
W79-03316

METHOD FOR OBTAINING SUBSTANTIALLY COMPLETE REMOVAL OF PHENOLS FROM WA STE WATER,
Exxon Research and Engineering Co., Linden, NJ. (Assignee).
M. L. Gorbaty.
U.S. Patent No. 4,113,615, 11 p, 2 fig, 7 tab, 8 ref; Official Gazette of the United States Patent Office, Vol 974, no 2, p 933, September 12, 1978.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Organic wastes, *Phenols, Adsorption, Hydrogen ion concentration, Coal, Char, Coal gasification plants.

Substantially complete removal from waste water of phenols and other organic compounds that dissociate in solution to produce organic anions and hydrogen ions can be obtained by contacting the waste water with char derived from a carbonaceous material whose ash contains a total of at least 15 weight percent calcium, magnesium, potassium and sodium expressed as oxides on a moisture free basis. The pH of the resultant slurry is maintained at a value such that the ratio of the highest dissociation constant of the organic compounds present to the hydrogen ion concentration of the slurry is less than about 0.1, and purified waste water is recovered. The char suitable for use as the adsorbent may be any carbonaceous product resulting from the partial thermal process of coal or other carbonaceous material. The material may be obtained from the carbonization, gasification, pyrolysis or liquefaction of coal. It is particularly advantageous to use char fines carried overhead with the product gas produced in a fluid bed gasifier as the adsorbent. Such utilization of the unconverted carbon in the fines enhances the economics of both the gasification process and the waste water treating process. (Sinha - OEIS)
W79-03317

BRINE PURIFICATION PROCESS,
Allied Chemical Corp., Morristown, NJ. (Assignee).
A. B. Gancy, and C. J. Kaminski.
U.S. Patent No. 4,115,219, 8 p, 1 fig, 1 tab, 6 ref; Official Gazette of the United States Patent Office, Vol 974, no 3, p 1473, September 19, 1978.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, Chemical wastes, Separation techniques, Chemical precipitation, *Brines, Water quality control, Product recovery.

An improved process for the purification of raw sodium chloride brines containing dissolved impurities including strontium, calcium and magnesium comprises (a) contacting the raw brine with sodium carbonate and solids recycled from step (d) for formation of strontium carbonate and calcium carbonate solids, (b) contacting the treated brine containing the carbonate solids with sodium hydroxide for formation of magnesium hydroxide solids, (c) removing a major portion of the strontium carbonate, calcium carbonate and magnesium hydroxide solids to provide a purified effluent and (d) recycling a portion of removed solids for admixture with the raw brine and sodium carbonate in the first step. (Sinha - OEIS)
W79-03319

TREATMENT OF AQUEOUS DISPERSIONS,
Monsanto Co., St. Louis, MO. (Assignee).
E. J. Griffith.
U.S. Patent No. 4,115,233, 6 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 974, no 3, p 1477, September 19, 1978.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Water quality control, Industrial wastes, Electrodes, Cathodes, Anodes, Zeta potential, Equipment, Electroendosmosis, Zonal concentration.

In many industrial processes, aqueous dispersions of solids are obtained as waste streams. Such waste streams often cannot be conveniently disposed of due to materials handling difficulties or ecological or safety considerations and are retains in large ponds, holding tanks, or other containment means. However, in the case of many aqueous dispersions, zonal concentration of the solids by settling takes place at an extremely low rate, if at all. This invention provides a process for increasing the rate of zonal concentration. A cathod is placed intermediate between a first cathode and anode. A direct current electrical potential is provided so that electroendosmosis may be used to increase the density of solids within the aqueous dispersion. The process and apparatus are for use on large impoundments (greater than 100 sq. m area). (Sinha - OEIS)
W79-03320

TREATMENT OF SEWAGE,
K. C. Smith, and M. E. Garrett.
U.S. Patent No. 4,115,258, 6 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 974, no 3, p 1485, September 19, 1978.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, Oxygen, *Oxidation, Biochemical oxygen demand, Hydrogen sulfide, Sewage.

Pure oxygen or a gas containing substantially more oxygen than air is injected under pressure into sewage held in or flowing through a rising or pumping sewer. This injection may be used to prevent the concentration of dissolved oxygen in the sewer falling to a level at which there occurs bacterial reduction to hydrogen sulphide of sulphate present in the sewage and/or to reduce the Biochemical Oxygen Demand of the sewage. The injection can also be used to oxidize to sulphur and sulphide dissolved in the sewage. The pure oxygen or the gas containing more oxygen than air may be injected into sewage flowing through a sewage pipe forming part of a rising or pumping sewer, into a pump used to transfer the sewage through the sewer, or into a part of the sewer (e.g. a sump) where sewage is collected before being transferred through the sewer. (Sinha - OEIS)
W79-03321

SELECTIVE REMOVAL OF IRON CYANIDE ANIONS FROM FLUIDS CONTAINING THIOCYANATES,
Rohm and Haas Co., Philadelphia, PA. (Assignee).
N. L. Avery.
U.S. Patent No. 4,115,260, 7 p, 2 ref; Official Gazette of the United States Patent Office, Vol 974, no 3, p 1486, September 19, 1978.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Industrial wastes, *Separation techniques, Ion exchange, Anion exchange, Inorganic compounds, Resins, Regeneration, *Cyanides.

The process of this invention comprises (a) contacting an aqueous fluid containing iron cyanide complex anions and other common ions including thiocyanate ions with a strongly basic, acrylic-based anion exchange resin to remove the iron cyanide complex anions from the fluid, (b) separating the resin containing the bound iron cyanide complex anions from the treated fluid containing the tiocyanate and other common ions, (c) regenerating the resin by contacting it with a brine solution to replace the adsorbed iron cyanide complex anions, (d) separating the spent regenerant containing the iron cyanide complex anions from the regenerated resin, which is now ready for re-use, and (e) where the resin particles form a bed or mass through which the treated fluid and regenerant flow, separating that portion of the regenerant which elutes later, and re-using the late-eluting portion without further treatment to regenerate spent resin. (Sinha - OEIS)

METHOD OF PURIFYING POLLUTED WATER,
Phillips Petroleum Co., Bartlesville, OK. (Assignee).
W. C. McCarthy, and R. O. Dunn.
U.S. Patent No. 4,115,264, 6 p, 1 fig, 1 tab, 8 ref; Official Gazette of the United States Patent Office, Vol 1974, no 3, p 1487, September 19,78.

Descriptors: *Patents, Water pollution treatment, *Waste water treatment, *Organic wastes, Water purification, *Oxidation, Catalysts, Alkali metals, Catalytic oxidation.

This invention provides an improved process for the catalytic oxidative purification of organically polluted waters. The life of a catalyst employed in the catalytic oxidation of organically polluted waters containing negligible amounts of alkali metal is extended by increasing the alkali metal concentration prior to subjecting the water to the catalytic oxidation. This invention is generally applicable to any aqueous phase and the catalyst and process conditions employed are those known in the art. (Sinha - OEIS)
W79-03324

WASTE WATER TREATMENT ROTOR,
C. P. Thissen.
U.S. Patent No. 4,115,268, 8 p, 10 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 974, No. 3, p. 1488, September 19, 1978.

Descriptors: *Patents, *Waste water treatment, Water pollution treatment, *Biological treatment, Equipment, Aeration, Aerobic conditions, Slime, *Biochemical oxygen demand.

The biological treatment of waste water for the removal of BOD involves the use of one or more partially submerged bodies forcibly rotated to expose the organisms on the contact surfaces to the atmosphere for the absorption of oxygen. The growth of the biological slimes on the surfaces of the rotating contactor is thereby encouraged. The lower half of the rotor is immersed in the waste water and the upper half is out of the waste water and exposed to the air. This invention incorporates in the biological treatment rotor, a stiff laminar or sheet material of an inert plastic material such as polyethylene which is provided with a multiplicity of irregularities or cup-like recesses spread substantially over its face. The sheet material is wrapped sprially around a central shaft so that there is a substantial number of flow passages for waste water and air in directions parallel to the axis and also around the periphery. Overall, the rotor is generally cylindrically shaped and the multiplicity of convolutions of the sheet material are maintained in spaced relation by the cup-shaped recesses. (Sinha - OEIS)
W79-03325

METHOD FOR RECOVERING VARIABLE-VALENCY ELEMENTS AND PURIFYING SEWAGE WATERS,
Anic S.p.A., Palermo (Italy). (Assignee).
G. Generini.
U.S. Patent No. 4, 116, 783, 3 p, 5 ref; Official Gazette of the United States Patent Office, Vol 974, no 4, p 2015, September 26, 1978.

Descriptors: *Patents, *Waste water treatme *Sewage treatment, *Separation techniques, Hea metals, Oxidation, Reduction(Chemical), Ele trolysis, *Metals, Ore treatment plants, Vanadiu Product recovery.

A method for stripping pollutant metals fr sewage waters from ore-treatment installations disclosed, which comprises the step of using, i short-circuited electrode system through whi the waters to be purified are flowed, a compou of an element which is other than the catho metal and is more electro-positive than the ano element. Striking results are obtained by treati vanadium-containing sewage waters from galliu ore treatment plants with silver sulfate in a copp iron electrode system. The method can be e ployed to recover other transition metals fr liquors which contain them. (Sinha - OEIS)

APPARATUS FOR INCREASING THE PH O WASTE WATER,
Mine Safety Appliances Co., Pittsburgh, PA. (A signee).
E. C. King.
U.S. Patent No. 4,116,834, 4 p, 3 fig, 4 ref; Offic Gazette of the United States Patent Office, V 974, No 4, p 2031, September 26, 1978.

Descriptors: *Patents, *Waste water treatme *Acid mine water, *Water pollution treatme *Hydrogen ion concentration, Lime, Mixin Equipment, Sensors.

There are situations in which it is desirable to tr waste water in order to increase its pH and to ho it at a predetermined value. For example, it desirable to neutralize acid mine drainage in th way. The object of this invention is to provide apparatus which is relatively simple in desig Lime from a hopper is fed to a lime slurry tank a variable speed feeder. The tank receives wa from a conduit in which there is a throttle val and a flowmeter. Slurry from the tank is deliver to a mixing tank that has an inlet for untreat waste water and an outlet for treated waste wat A sensor responsive to the pH of treated wa water leaving the mixing tank controls a device f operating the throttle valve, and the flowmet controls a device for operating the lime feeder keep the concentration in the slurry tank substa tially constant regardless of the rate of flow out that tank. (Sinha-OEIS)

BIOLOGICAL NITRIFICATION AND DEN TRIFICATION USING ROTATING BIOLOG CAL CONTACTORS,
Northeastern Univ., Boston, MA. Dept. of Ci Engineering.
J. C. O'Shaughnessy, F. C. Blanc, P. Brooks, D. Connick, and A. Silbovitz.
Massachusetts Water Resources Research Cent University of Massachusetts, Amherst, WRR Publication No. 97, July 1978. 107 p, 32 fig, 9 tab, ref, 4 append. OWRT A-085-MASS(1), 14-3 0001-6022, 14-24-0001-7046.

Descriptors: *Biological treatment, *Denitrific tion, *Nitrification, *Waste water treatment, Aer bic bacteria, *Rotating biological contactors.

This study evaluated the ability of Rotating Bi logical Contactors (RBC) to provide biologic nitrification and denitrification of secondary tre ed domestic wastewater. The study involved bo bench scale and pilot scale testing. The resu indicated that the ammonia nitrogen applicatio rate and volume to surface ratio of the unit a major design parameters to achieve proper nitri cation with RBC units. Ninety four percent amm nia conversion was observed for an ammonia loa

rate of 0.20 lbs. NH3-N/1 1000ft2-day. In order achieve a high degree of nitrification, a minim of two stages should be used in RBC unit ign, and supplemental alkalinity addition may required. The denitrification study indicated t RBC units can be used to achieve biological itrification of domestic wastewater. (Godfrey-ss)

e suitability of the Float Wash and Bauer Hysieve devices for treatment of high-solids paper chine white waters in closed-circuit paper mills s investigated. Despite their different operating nciples, both devices were found suitable for nomical effluent purification; the Hydrasieve med better suited for cleaning suspensions with her solids contents (long fibers and fiber buns), while the Float Wash apparatus seemed re adequate for lower-solids paper machine ite waters. The clarified water should, however, subjected to a second purification stage before ng recirculated for reuse. Depending on the ality and volume of white water to be treated, h devices can be amortized within 2-4.5 years. rown-IPC)

egradation kinetics for the treatment of straw per waste water in an activated sludge process e studied and a kinetic model is derived for both tch and continuous experiments. These two ethods are reasonably equivalent only when ther low concentrations of substrate are inlved. Both models, however, show a depennce upon concentration corresponding to that nich is typical of multicomponent substrate degdation. The kinetic model derived from continus tests appears to be more suitable for designing dustrial processes in that it avoids oversizing of e aeration unit. (Swichtenberg-IPC)

Effluent treatment at the creped-paper mill of Bowater Scott Corp. Ltd. (United Kingdom) consists of Kenfil inclined screens for fiber recovery and Ceca-Wabag contact flocculators to remove fines from the effluent streams in the presence of alum, polyelectrolytes, and activated sludge. The supernatant from the flocculators is pumped back to the paper mill for reuse by the Yankee tissue machines. Fresh water consumption and total fiber loss have been reduced by about 45 and 70%, respectively. (Swichtenberg-IPC)

Bleach plant effluents from kraft pulp mills containing in solution organic colored materials stemming especially from lignin and its degradation products on one hand and mineral chlorides in significant quantities on the other hand are subjected to decoloring with separation of the colored organic materials in a concentrated form. This is followed by aqueous dilution of the separated colored organic concentrate, preferably using an effluent poor in aqueous chlorides. The diluted concentrate is then subjected to ultrafiltration to obtain a final concentrate with a mineral chloride content low enough to be recycled for heat recovery without risk of excessive corrosion. Electrochemical coagulation of kraft mill effluents based on the formation of metal hydroxides during anodic dissolution of metal electrodes was investigated. Rectangular steel electrodes with a working surface of 1.0-3.4 sq um served as anodes, using a current flow of 100-300 amp-hr/cu m. Purification effectiveness was evaluated by changes in the carbon, iron, and phenol contents and COD measurements before and after purification. The effect of pH on the degree of purification depended on the nature of the effluent. Optimum pH for the purification of effluents from the first alkaline extraction stage after chlorination was 11.5. Other effluents were satisfactorily purified at pH 4.5-7.0. Tabulated data indicated that the carbon content, color, and COD of the effluents were reduced by 70-90%. Phenol content was reduced by 50-60%. Use of electrochemical coagulation for purification of heavily contaminated effluents can reduce the load on biological purification and simplify it. (Chern-IPC)

A foam flotation activated sludge process was developed for the biodegradation of spent sulfite liquor, which removed 85% of the BOD from concentrated pulp mill waste having a pretreatment BOD level of 24,000 mg/liter. It is based on an autolytic culture system. The process has no sludge wastage requirement in the autolytic model associated with maximum BOD removal. When the reactor retention time was decreased from 2.3 to 1.3 days the process became nonautolytic and operated at 50 to 60% BOD removal efficiency, generating biomass as a by-product. The process was operated continuously on a pilot-plant scale for more than 5 months in the autolytic mode. Operating parameters were established at three levels of nutrient chemical additions. An investigation of the main process streams in a large refiner mechanical pulp (chip groundwood) mill has given information on the movement of water-soluble components from the wood fiber to the white water and thence to the effluent. The COD of the mill effluent ranged from 2,000 to 3,500 mg/liter, but 100-1,500 mg/liter of this could be eliminated by removal of fiber and fines. The effluent's COD dropped from 45 to 25 kg/ton as the total mill water consumption was reduced from 30 to 15 cu m/ton. The 5-day BOD of the water flows generally followed the same pattern as the COD, except when old chips were being pulped at which time lower BOD levels were measured. (Brown-IPC)

The Float-Wash system for separating fibers from a stream of water in a pulp or paper mill is based on spraying the water upward through a screen using a full-cone nozzle. The fine fraction passing through the screen forms water column above the screen while the coarse fiber fraction migrates to the periphery of the screen and falls into a container. Float-Wash units are installed in series similarly to cleaners and are mainly employed in cleaning water being recycled for use, e.g., as paper machine shower water. Installations in a tissue mill and a fiberboard mill are diagrammed. (Speckhard-IPC)

Descriptors: *Pulp and paper industry, *Water pollution control, *Soviet Union(USSR), Water pollution treatment, Water pollution sources, Wastes, Industrial wastes, Waste treatment, Pulp waste, Water supply, Effluents, Biological treatment, Activated sludge, Coagulation, Chemical oxygen demand, Color, Phenols, Suspended solids, Sludge treatment, Dewatering, Treatment facilities, Flotation, Filtration, Filters, Foreign countries, Aluminum sulfate, Kraft mills, Board mills.

Water supply and effluent treatment systems used in the Baikal and Selenga pulp and paper mills (USSR) are described. The Baikal mill effluent from the production of 200,000, 10,000, and 10,000, and 10,000 tons/year of pulp, fodder yeast, and board, respectively, is treated in a biological treatment plant without a mechanical stage. The activated sludge treatment is followed by chemical-mechanical treatment using alum as a coagulant. The total effluent volume is 12,000 cu m/hr, and the treated effluent has a COD of 2-3 mg/liter (Kubel), a color of 70-80 Pt units, 600 mg/liter of mineral solids, 0.015-0.020 mg/liter of phenols, and 20-30 mg/liter of suspended solids. Excess activated sludge as well as chemical sludge has been stored in Lagoons. A dewatering system is currently under construction for biological sludge, utilizing flotation thickeners and belt filters. A combination of gravity thickeners and pressure filters is being considered for dewatering of the chemical sludge. The Selenga mill produces 240,000 tons/year of kraft pulp and board. The discharge from the mill includes 0.39, 9.8, 0.39, and 49 tons/day of 5-day BOD, COD, suspended solids, and dissolved inorganic materials, respectively. Extensive reconstruction of the mill is planned, including many in-mill changes that will further reduce the pollution load. (Trubacek-IPC)

BACTERIAL CHARACTERISTICS OF ACTIVATED SLUDGES TREATING CARBOHYDRATE WASTES,
Tokyo Metropolitan Univ. (Japan) Dept. of Biology.
S. Takii.
Water Research Vol. 11, No. 1, p. 85-89, 1977. 25 ref, 5 tab.

Descriptors: *Activated sludge, *Bacteria, *Carbohydrates, *Waste water treatment, Wastes, Industrial wastes, Waste treatment, Water pollution treatment, Water pollution sources, Pulp wastes, Pulp and paper industry, Effluents, Sludge, Microorganisms.

A bacteriological study was conducted on six activated sludge samples from actual plants treating carbohydrate wastes (kraft pulp mill, brewery, yeast culture, confectionery, fruit juice, and soft drink effluents), and the results are compared with the metabolic activities of the sludges and the qualities of the wastes. The sludges tested contain about 100 billion viable bacterial cells/g dry sludge. About 50 strains of bacteria isolated from each sludge sample were classified into groups according to their morphological and physiolo cal properties. Many isolates could not grow glucose as the sole carbon and energy source, ev if they were isolated from the sludges treati wastes which contained predominantly carboh drate. Most of the dominant groups of the sludg treating wastes with a low proportion of carboh drate were Gram-negative rods and were similar the genera of the sludge grown on sewage repo ed by other investigators. Their rates of oxyg consumption were higher when they were fed w casamino acids than with glucose. On the oth hand, in the sludges treating the wastes with a hi proportion of carbohydrate, Gram-positive nc spore-forming bacteria (probably belonging Corynebacterium) and lactic acid bacteria and re tively large coccus predominated. Many strains these groups had the ability to accumulate reser polysaccharide and showed a higher oxygen co sumption with glucose than with casamino acids acetate. (Witt-IPC)

earch was conducted to determine: the main
rce of waste petroleum oils and lubricants
L's) at Red River Army Depot (RRAD); suit-
methods of minimizing the amount of waste
L's generated by RRAD; and the optimum
hods for disposal of the waste POL's. The
es of POL's were found to be crankcase drain-
s, diesel fuel, gasoline, transmission fluid, brake
d, hydraulic fluid, water, and solvents with the
amometer shop being a major contributor of
ste POL's. Waste POL's are collected in 55
lon drums and, in the case of the dynamometer
p, in a holding tank in the basement of the shop.
ur suggestions for reducing waste POL volume
discussed: reuse fuel from retrograde vehicles
eived RRAD for fueling depot vehicles; reuse
l from retrograde vehicles for Code F vehicles;
rease oil change interval for most depot equip-
nt; and reuse of oil used in the Depot's Dyna-
meter Engine Test Shop. Eight methods of
posal of waste POL are described and examined
the basis of economics and compliance with
my, local, State, and Federal regulations. Con-
ering these selection criteria, and quantities,
es, and collection of waste at RRAD, it is
ommended that the two types of disposal most
table are combustion for heat recovery (burn-
) and sale to an entrepreneur. (Gibson-IPA)

ree general approaches for absolute contaminant
noval from a land area extending 1/2 square mile and 25 feet deep are considered in this state-of-the-art study. The adverse environmental effects of contaminated land areas manifest themselves in the following manner: (1) groundwater contamination due to leaching from the land; (2) contamination of surface water due to land run-off; (3) inhibited plant growth; (4) contaminant absorption by vegetation and transfer through the food chain; (5) air pollution from evaporation, sublimination, and wind erosion of contaminated soil; (6) direct contact poisoning; and (7) fire and explosition. The first method, excavation and treatment, utilizes incineration and revegetation and wet chemical processing. In situ treatment involves soil activation, vegetational uptake, innoculation, and fixation. Groundwater treatment methods include upgradient diversion and downgradient collection and treatment. These methods are compared regarding technical and economic feasibility. Schematic process flow sheets are provided for rotary kiln soil detoxification, reconstituting soil from incinerated material, chemical soil detoxification, possible sequencing of soil manipulation, and one alternative for groundwater decontamination. Incineration at sea has been deemed a relatively environmentally safe method for disposal of toxic chemical wastes. The impact of such a disposal method on the ocean environment is examined. The marine environment is regarded as two zones: (1) the coastal ocean which includes estuaries, adjacent wetlands, lagoons, waters over the continental shelves, and the marginal seas; and (2) the open ocean. Consideration is given to the U.S. development of an incinerator vessel; and the design, operation, and equipment of the Dutch ship, VULCANUS, designed to deal with chlorinated hydrocarbon wastes, is described. The potential hazards involved with the use of such vessels are the accidental release of harmful substances because of mishaps. It is concluded that combustion in the open ocean of toxic chemical wastes has a minimal adverse impact on the marine environment when stringent safety regulations are strictly observed. Combustion efficiencies are above 99.9% in the conversion of chlorinated hydrocarbons to water vapor, carbon dioxide, and hydrogen chloride. The principal concern of accidental spills at sea is the absorption of toxic substances by food fish. Safety control measures are detailed and alternative methods are considered. Comments on the Draft Impact Statement requested from various agencies and states are included. (Davison-IPA)

COMPOSTING AT JOHNSON CITY: JOINT USEPA-TVA COMPOSTING PROJECT WITH OPERATIONAL DATA, 1967-1971. VOLUMES I AND II,
Environmental Protection Agency, Washington, DC. Office of Solid Waste.
G. E. Stone, and C. C. Wiles.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 047, Price codes: A16 in paper copy, A01 in microfiche. Final Report No EPA/530/SW-31r.2, November 1975. 358 p, 80 fig, 48 tab, 21 ref, 6 append.

Descriptors: *Waste treatment, *Municipal wastes, *Waste disposal, *Composting, Animal wastes, Sewage, Decomposition, Treatment facilities, Degradation, Microbiology, Microorganisms, Equipment, Laboratory tests, Lime, Nitrogen, Phosphorus, Potassium, Organic compounds, Monitoring, Johnson City, Tennessee, Sewage sludge, Cost analysis, Public health.

A joint research and demonstration project in windrow composting of municipal solid wastes and sewer sludge is discussed. The project began in June 1967 and was terminated on June 30, 1971. A total of 33,503 tons averaging 37 tons/day of sewer sludge, cow manure, paunch manure, poultry manure, animal blood, pepper canning wastes, and municipal waste were composted in windrows. Windrow temperatures were maintained at 122F to 130F for seven days to destroy the pathogens contained in the refuse. Windrow temperatures at the 1 1/2 ft. level averaged above 140F for two or three weeks, and it was determined that the compost was safe with regard to potential health problems. The technical feasibility of windrow composting of municipal wastes and sewer sludge was established; the quality of the compost was continually upgraded during the project. Plant construction costs totaled $960,452; mobile equipment used in plant operations cost $61,280. Operating costs for 1968 were $18.45/ton of refuse processed; 1971 operating costs were $19.70 tons. Cost estimates for various sized plants, based on the study data, are presented. The composts obtained from this plant were lower in phosphorus nitrogen and potassium than commercial inorganic fertilizers but did contain micronutrients required for good plant growth. Favorable responses to compost under field demonstration conditions were from high cash value crop producers and home and garden users. During the project, medical surveillance of the composting plant employees was maintained, and it was determined that no significant abnormalities were found among them. (Davison-IPA)

A COMPREHENSIVE STUDY OF SUCCESSIONAL PATTERNS OF PLANTS AND ANIMALS AT UPLAND DISPOSAL AREAS.
Coastal Zone Resources Corp., Wilmington, NC.
Final Report, Contract D-77-2, March 1979. 515 p, 45 fig, 101 tab, 163 ref, 5 append. DACW39-74-C-0092.

Descriptors: *Waste disposal, *Dredging, *Biological communities, *Biota, *Habitats, Vegetation, Ecology, Sites, Terrestrial habitats, Biological properties, Ecology, Succession, Vegetation, Biorhythms, Vegetation regrowth, Wildlife.

Five sites were selected for active research to collect biophysical data concerning the ecological succession on upland dredged material substrates. The study was based on one sampling area for each of the following: (1) Mott Island, Connecticut, in the Connecticut River; (2) six disposal islands in Hillsborough Bay, Tampa, Florida; (3) a disposal area associated with Whiskey Bay Pilot Channel in the Atchafalaya River Basin, Louisiana; (4) a disposal area associated with the Gulf Intercoastal Waterway between Port Arthur and Galveston, Texas; and (5) Mott Island in the Columbia River near Astoria, Oregon. On-site analysis of the biota combined with ingterpretation of available historical photography, disposal history data, and summary knowledge of regional biophysical characteristics were used to hypothesize past, present and future successional changes. All of the areas studied exhibited characteristics of insular habitats, whether or not they were constructed as true islands, or were land disposal sites due to the similar factors affecting the ecological succession. It is concluded that careful design of disposal sites, through active stocking, could enhance habitat and biotic diversity, or hasten the succession and self-perpetuation of biotic communities. The potential for habitat management on upland dredged material disposal areas is dependent on recognizing the productive seral stages supported by such factors as soil conditions, climate, flooding, fire, and intermit-disposal area, for example: islands are good bird breeding habitats, but unsuitable for timber. (Davison-IPA)

SURVEY OF METHODS USED TO CONTROL WASTES CONTAINING HEXACHLOROBENZENE,
TRW Systems, Inc., Redondo Beach, CA.
S. Quinlivan, M. Ghassemi, and M. Santy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-253 051, Price codes: A05 in paper copy, A01 in microfiche. Final Report No. EPA/530/SW-120c, November 1976. 95 p, 2 fig, 30 tab, 39 ref, 1 append. 68-01-2956.

Descriptors: *Waste disposal, *Ultimate disposal, *Hexachlorobenzene, *Industrial wastes, *Water pollution sources, Waste treatment, Data collections, Surveys, Solvents, Pesticide residues, Landfills, Deep-well pumping, Ponds, Incineration, Burning, Hazards, Environmental control.

Results of a survey to identify the sources and characteristics of manufacturing wastes containing hexachlorobenzene (HCB), to review and document methods used for treatment and disposal of HCB wastes, and to evaluate the environmental adequacy of the treatment and disposal methods are presented. Based on a literature search and some contact with industry, 14 industries/operations were identified as possible sources of HCB wastes. Of these, chlorinated solvents production and pesticide manufacturing were found to be the two major sources. Methods currently used for the ultimate disposal of HCB include land disposal (sanitary landfill, industrial landfill, deep well injection and drying ponds), incineration (with or without byproduct recovery), open pit burning, resource recovery, discharge to municipal sewage treatment plants, and emmission to the atmosphere, with land disposal being the most prevalent method. Results of an evaluation of the methods indicate that incineration with emission control and byproduct recovery is the most desirable and environmentally acceptable technology for the destruction of HCB wastes. DESTRUCTION OF POLYCHLORINATED BIPHENYLS IN SEWAGE SLUDGE DURING INCINERATION,
Versar, Inc., Springfield, VA.
F. C. Whitmore.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 162, Price Codes: A05 in paper copy, A01 in microfiche. Final Report, 1976. 73 p, 22 fig, 16 tab, 11 ref, 1 append. 68-01-1587.

Descriptors: *Incineration, *Sludge disposal, *Polychlorinated biphenyls, *Sewage sludge, Air pollution, Solid wastes, Waste disposal, Aromatic compounds, Chlorine, Gases, Testing, Effluents.

To determine the efficiency with which polychlorinated biphenyls (PCB's) are destroyed in a municipal sewage sludge incinerator, an experiment was conducted in which the sludge input to an incinerator was deliberately doped with a suitable PCB preparation (Aroclor 1254) at a level of 50 ppm (dry weight). Samples were taken of the afterburned gases, the stackgases, scrubber water output and ash (from the bottom hearth) after allowing the furnace to come to equilibrium. Results showed: no PCB in either scrubber water effluent or in the ash; combustion proceeded with great rapidity in the high temperature, water saturated gas stream prior to quenching; less than 6% of the injected PCB's escaped destruction; and very little PCB on the particulate matte either the afterburner breach or in the stack exhaust. (Gibson-IPA).

MIUS TECHNOLOGY EVALUATION - WATER SUPPLY AND TREATMENT,
Oak Ridge National Lab., TN.
A. L. Compere, W. L. Griffith, W. J. Boegly, Jr., I. Spiewak, and D. G. Thomas.
Available from the National Technical Information Service, Springfield, VA 22161 as ORNL-HUD-MIUS-21, Price codes: A07 in paper copy, A01 in microfiche. Report No. ORNL/HUD/MIUS-21, April 1976. 144 p, 29 fig, 36 tab, 118 ref, 1 append. W-7405-eng-26.

Descriptors: *Modular Integrated Utility System Program, *Water supply development, Water treatment, *Technology, Utilities, Water works, Water quality, Potable water, Water quality, Groundwater, Surface water, Coagulation, Desalination, Disinfection, Filtration, Flocculation, Costs, Separation techniques.

Methods and processes which could be used in the Modular Integrated Utility System (MIUS) Program for the treatment of potable water are evaluated. Treatment required to provide potable water varies with the quality of the water supply. Water quality and treatment processes appropriate for ground and surface waters are examined. Ground waters usually require less treatment, and many supplies may need only disinfection and/or softening; costs of providing potable water from ground supplies are considerably lower than those of providing water from other sources. The technology discussed is largely appropriate to the treatment of surface water supplies. Many surface water supplies can be suitably treated through the use of small, commercially available pre-engineered water treatment plants, but a separate evaluation of the treatment appropriate for each MIUS site is recommended. Costs for these plants are similar to extrapolated capital costs of conventional treatment plants; it is indicated that cost/unit size increases as plant capacity decreases. A treatment system for MIUS potable water may include disinfection, coagulation and flocculation, solids separation, and filtration. The provision of additional labor may be necessary for compliance with regulatory agency standards; automation will reduce onsite labor. Technology, available for the treatment of brackish water supplies, provides high quality potable water. Provision of fire protection water should be considered in an economic evaluation, because it represents a large portion of the water treatment plant and carriage costs for MIUS. (Davison-IPA)

OZZLE FOR ROTARY FILTER PIPE,
E. Stuart, Sr.
S. Patent No. 4,113,183, 4 p, 5 fig, 8 ref; Official zette of the United States Patent Office, Vol 4, no 2, p 793-794, September 12, 1978.

Descriptors: *Patents, *Water treatment, *Water purification, Water quality control, Filtration, Filters, Equipment, Nozzles, Turbulent flow, Backwashing, Sand filters.

In sand type filters, a pipe is placed beneath the surface of the sand bed and is rotatable on a vertical axis, located in the middle of the length of the pipe. It has nozzles extending along the trailing side of the pipe on each side of the axis of rotation. When these nozzles are supplied with fluid under pressure they cause the pipe to rotate and the water from the nozzles will agitate the filter and wash it. A nozzle for this purpose is illustrated in U.S. Pat. No. 3,351,292 and the present invention represents an improvement by providing additional passages for fluid from the nozzle which not only assist in impelling the pipe in its rotary action but also provide for increased agitation of the filter bed. (Sinha - OEIS)

PROCESS FOR TREATING DRINKING WATER AND SEWAGE,
H. Corte, H. Heller, M. Lange, and O. Netz.
U.S. Patent No. 4,115,261, 4 p, 1 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 974, no 3, p 1486, September 19, 1978.

Descriptors: *Patents, *Water treatment, *Water purification, Water quality control, Waste water treatment, Water pollution treatment, Organoleptic properties, *Odor, *Taste, Adsorption, *Resins, *Polymers, Organoleptic properties.

A process removes oleophilic odor- and tasteproducing substances from water by treating the water with an insoluble, macroporous adsorber resin comprising a matrix based on a cross linked organic polymer containing aromatic nuclei. The polymer contains chloromethyl groups as substituents and some of the chlorine atoms in the chlormethyl groups can be reacted with ammonia or amines. Furthermore the invention relates to the adsorber resins to be used in the claimed process. (Sinha - OEIS)

WATER PURIFICATION METHODS,
International Telephone and Telegraphy Corp., Nutley, NJ. (Assignee).
E. W. Sawyer, Jr.
U.S. Patent No. 4,116,826, 9 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 974, no 4, p 2028, September 26, 1978.

Descriptors: *Patents, *Water treatment, *Water purification, Water quality control, Adsorption, *Clays, Toxins, Heavy metals, Pesticides, Viruses, Hormones, Attapugite clay, Regeneration.

Various grades of attapulgite clay and sepiolite are used to treat water using contacting or percolation techniques to remove substances not removable by standard water purification methods under many conditions. Substances such as pesticides, toxins, hormones, heavy metal cations and viruses are removed from water by adsorption upon the clay surface. When contacting is employed, the clay containing the adsorbed substances is subsequently removed by sedimentation or filtration. The clays can be regenerated by appropriate chemical or thermal techniques. (Sinha - OEIS)

COST OF SANITARY LANDFILL DEVELOPMENT AND OPERATION IN ILLINOIS,
Andrews (James Douglas), Springfield, IL.
J. D. Andrews.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-265 546, Price codes: A06 in paper copy, A01 in microfiche. Final Report No. IIEQ 76-15, July 1976. 116 p, 10 fig, 13 tab, 42 ref. 40.024.

Descriptors: *Landfills, *Costs, *Cost analysis, Operating costs, Maintenance costs, Waste treatment, Solid wastes, Surveys, Sites, Project planning, Equipment, Illinois, Cost comparisons, Waste disposal.

A study of private and public owned sanitary landfills accepting residential refuse and serving communities in Illinois is reported. Forty-five sites were selected for interviews on the size of operation, type of ownership and operation, and location within the state. Surveys were conducted at 23 sites representing about 10% of the total number of residential refuse sanitary landfills in Illinois. A literature review of sanitary landfill practices and costs, conducted for the period 1970 to 1975, provided a basis for comparison with current developmental, operational and closing costs. Landfill development is presented, and includes: planning an engineering, site development, site operation, and site closing and maintenance. Sanitary landfill sites were classed into five categories according to their size and the amount of refuse processed per week. Summaries of cost data are presented according to these categories. EVALUATION OF POLLUTION CONTROL IN FOSSIL FUEL CONVERSION PROCESSES; GASIFICATION: SECTION 5. BI-GAS PROCESSES,
Exxon Research and Engineering Co., Linden, NJ.
C. E. Jahnig.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-243 694, Price codes: A04 in paper copy, A01 in microfiche.

Final Report No. EPA-650/2-74-009-g, May 1975. 73 p, 3 fig, 16 tab, 38 ref. 68-02-0629.

Descriptors: *Coals, *Air pollution, *Coal gasification, *Environmental effects, Water pollution, Air pollution control, Wastes, Pollution abatement, Trace elements, Effluents, Liquid wastes, Solid wastes, Sulfur, Fossil fuels, Gases.

Results of a study to evaluate environmental aspects of the BI-GAS coal gasification process are presented. Modifications were made to the commercial plant projections developed by Air Products and Chemicals, Inc., which was used as the basis for the study. The plant design includes shift conversion and methanation to produce a gas with a heating value of 943 Btu/cu ft., available at 1,075 psia. The plant, sized to make 250 million SCFD of pipeline gas, uses Western Kentucky coal. The coal is cleaned and washed, and 14,535 tons/day provide all the fuel for drying and utilities production and the gasification requirements. Effluents to the air and liquid and solid effluents generated by the process are examined. Preparation of the raw gas so that it can be methanated to higher Btu pipeline gas is described. Although the trace elements contained in coal are less than 1% concentration, their potential environmental impact is considered. Alternatives to improve the thermal efficiency of the process include: the addition of facilities to control sulfur emission on furnaces firing high sulfur coal; flue gas clean-up; dust recovery; and general efficiency items to conserve fuel. Areas requiring further study are discussed. (Davison-IPA)

GUIDE TO CRITERIA FOR LABORATORY EVALUATION OF BACKFLOW PREVENTION DEVICES FOR PROTECTION OF POTABLE WATER SUPPLIES,
National Engineering Lab. (NBS), Washington, DC. Center for Building Technology.
G. C. Sherlin, R. W. Beausoliel, and L. S. Galowin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 303, Price codes: A07 in paper copy, A01 in microfiche. Final Report No NBSIR 76-1020, March 1976. 44 p, 2 fig, 4 tab, 14 ref, 1 append. 462,4190. EPA-IAG-0170(D)A.

Descriptors: *Materials testing, *Water quality control, *Potable water, Fluid mechanics, Laboratory tests, Field tests, Valves, High pressure valves, Design criteria, Performance, Specifications, Reliability, Equipment, Plumbing, Water supply.

Detailed requirements, criteria and test procedures for rating reduced pressure principle back pressure backflow preventors are outlined. This type of device consists of two independently acting check valves, internally force loaded to a normally closed position, and separated by a chamber with an automatic relief for venting to the atmosphere, which is internally force loaded to a normally open position. They operate under continuous pressure. Details are given on criteria for: size, working pressure, flow capacity, structural strength, mechanical function, misassembling, evidence of failure at barriers, location of test cocks, debris collection at relief valve opening, leakage, repairability, release of trapped air, corrosion resistance, and durability. Laboratory testing includes hydrostatic tests of the complete housing and the outlet. Field tests include operation of differential relief valve, testing check valves No. 1 and No. 2. Instructions for marking and installation are given and terms are defined. A leakage test developed at Oak Ridge National Laboratory is discussed. (Davison-IPA)

EFFECTS OF MOSQUITO CONTROL DITCHING ON JUNCUS MARSHES AND UTILIZATION OF MOSQUITO CONTROL DITCHES BY ESTUARINE FISHES AND INVERTEBRATES,
North Carolina Univ. at Chapel Hill. Inst. of Marine Sciences.
H. L. Marshall.
PhD Dissertation, 1976. 197 p.

Descriptors: *Salt marshes, *Ditches, *Marsh plants, Wetlands, Marshes, Tidal marshes, Aquatic animals, Aquatic habitat, Fish, Aquatic invertebrates, Spoil banks, Vegetation establishment, *North Carolina.

Large areas of irregularly flooded North Carolina salt marsh dominated by Juncus roemerianus have been ditched in an attempt to control mosquito breeding. Ditching increased the area of available aquatic habitat in the marshes by a factor of about five, but spoil piles now occupy 10-13% of the ditched marsh. The ditches were inhabited by numbers of juvenile fishes, crabs, and shrimps, especially during late winter, spring, and early summer. The ditches increase the amount of nursery area available for fishes and invertebrates including some of commercial and sports interest. Except for the direct effects of the spoil which was piled on top of the marsh during ditching, no large changes were evident in the density and growth of adjacent Juncus. Bushy vegetation, especially Buccharis and Iva, had invaded many of the spoil piles and in some cases had grown up along the ditches. Many spoil piles were not covered significantly by vegetation even after eight years. Erosion of spoil piles continues to form water-retaining levees along ditches. (Steiner-Mass)

FACTORS UTILIZED IN THERMAL POWER PLANT SITING: A REVIEW THROUGH THE MID-19702,
Clemson Univ., SC. Dept. of Environmental Systems Engineering.
B. C. Dysart, III, and A. Kellizy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 700, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Institute. Clemson University, Report No 72, April 1978. 31 p, 10 tab, 49 ref. OWRT B-049-SC(2).

Descriptors: *Thermal powerplants, *Site selection, *Thermal pollution, Environmental effects, *Sites, Reviews, Costs, Available water.

Described is the evolution of siting factors and criteria for locating thermal electric power generating stations. Until the early 1960s, such factors were generally limited to land costs, site preparation costs, delivered fuel costs, transmission costs to the load center, and availability of the cooling water needed. The advent of nuclear power plants led to other important considerations in screening and finally selecting a thermal power plant site. Included were geological analysis for fault-free foundations, hydrologic analysis to reveal the consequences of accidental radiological emissions to surrounding waters, and meteorological analysis to discover the possible fate of emissions to the air. With the 1970s, the siting process became increasingly involved with a variety of environmental, political, institutional, and social factors in addition to added technical and economic factors. The anticipated trend for the future, as of 1973, was determined based on interviews with utility, industry trade association, consulting firm, and regulatory agency personnel.

Bowling Green State Univ., OH. Dept. of Soci gy.
J. E. Kivlin, F. C. Fliegel, and N. Sharma.
Small Town, Vol. 6, No. 12 p. 7-10, June 197 tab, 17 ref.

scriptors: Economics, *Surveys, Public health, linois, *Sanitation, *Water pollution control, Af- native action.

sed on self-administered questionnaires given to voting age adults in a town of about 2700 idents, this paper concludes that information npaigns which attempt to move people into rmative action on water pollution control issues uld be successful in small communities. The a revealed that favorable pollution control atti- les in small communities correlated positively h information gained through oral and written nmunications. The data also indicated a relative ence of demographic relationships in responses. us, concern for pollution control appears to be dely distributed; blue-collar workers' relatively v educational and occupational prestige levels not likely to represent major obstacles to the cess of small community pollution control cam- gns. Overcoming perceived self-interest, ac- ding to questionnaire analysis, should perhaps the main concern of pollution control cam- gns. Contradictory positions by surveyed indi- uals on a local pollution problem and what to about it could often be attributed to 'subjective s'; opinions and behavior oriented towards en- ncement of self. Campaigns which plan against bias in their strategies, suggests the study uld prove successful.

RESIDUALS MANAGEMENT PRIORITIES FOR THE MONONGAHELA RIVER BASIN.
Resource Planning Associates, Inc., Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 900, Price codes: A09 in paper copy, A01 in microfiche. Prepared for Appalachian Regional Commission, Washington, D.C., Final Report, July 1976. 27 tab, 18 append. 76-28 CO-4410-75I-302-0624.

Descriptors: *Water quality, *Air pollution, *Water pollution, *Air quality, *Model studies, *Appalachia, *Monongahela River Basin, *Environmental quality, *Residuals management, *Resources management, *Residuals Management Priority Model, Natural resources, Public investments, Cost-benefit analysis, Population, Environmental effects, River basins, Land subsidence, Solid wastes, Public health, Strip mining, Data inventory.

The purpose of this report is to adapt the Residuals Management Priority Model (RMPM) to the needs of the Appalachian Regional Commission and to the specific characteristics of the Monongahela River Basin. The model identifies pollutants or residuals associated with processes/sources; and receptors or elements that are affected by the pollutants. Then, to calculate damages in a given geographical area, the level of pollution in the area and levels of the presence or density of the receptors in the area are measured. These damages are ranked according to the following value systems: impact on long-term quality of natural resources; impact on health hazards caused by population; impact on economic costs of pollution in the basin from the view point of the nation and of the region; and impact on damages from the viewpoint of the individual. Damages associated with 20 pollutants in the Basin were evaluated for these value systems. The pollutants that cause the greatest damage in all value systems are strip mining, acidity/alkalinity, solid waste, coliform, sulfur oxides, and pH. The least damage is caused by subsidence, hydrocarbons, dissolved oxygen, and thermal pollution. Details of the methodology, findings and recmmendations are listed in the report. The information is supplemented by appendices that document the data base used, that list major data entries and references, and that present a glossary of key technical terms employed in the study. This report is intended as a summary of results from Phase I of the study. Phase II of the model will consist of a cost/benefit analysis of alternative pollution abatement strategies. (Coan-NC)

WATER AND SEWER FUNDING PROGRAMS AT FMHA, EDA, AND HUD: A SURVEY OF ENVIRONMENTAL IMPLICATIONS,
National Wildlife Federation, Washington, DC. Resources Defense Div.
P. Slesinger.
Prepared for Council on Environmental Quality, Washington, D.C., March 1, 1977. 53 p.

Descriptors: *Water quality, *Water supply, *Interceptor sewers, *Government finance, *Farmer's Home Administration, *Economic Development Administration, *U.S. Dept. of Housing and Urban Development, *Funding programs, Water supply development, Public utilities, Water distribution, Community development, Water management(Administrative) Planning, Federal government, Government supports, Environmental effects, Public works, Environmental impact statements, Growth.

This report determines whether the public works programs of certain federal agencies induce sprawl and adverse environmental changes. The programs of the Farmer's Home Administration (FmHA), the Dept. of Housing and Urban Development (HUD), and the Economic Development Administration (EDA) are examined in relation to the construction and expansion of water supply and sanitary sewer systems, particularly interceptor sewers and water transmission lines. The various programs of each agency are briefly summarized, described in terms of awards and loan obligations, assessed terms of funding patterns, and analyzed as to the adequacy of each agency's NEPA regulations with respect to the CEQ guidelines and other non-NEPA environmental regulations. To the extent possible, the report assesses the quality of environmental review by the agencies and the impact of their projects on the environment. Data were collected from each agency's annual fiscal report, agency regulations, agency field instructions and environmental impact statements, and interviews. Conclusions and recommendations for each agency are provided. Indications are that of the three agencies, EDA is doing the best job. Both FmHA and HUD programs are creating adverse environmental impacts. The main conclusion is that the sewer and water programs of EDA, FmHA and HUD should be administered by one agency. (Coan-NC)

SPILL RISK ANALYSIS PROGRAM: METH- ODOLOGY DEVELOPMENT AND DEMON- STRATION. FINAL REPORT,
ORI, INc., Silver Spring, MD.
L. A. Stoehr, C. H. Morgan, F. J. Reiffler, and P. M. Tullier.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A043 954, Price codes: A13 in paper copy, A01 in microfiche. Sponsored by Department of Transportation, U.S. Coast Guard Headquarters, Office of Research and Development, Report No. CG-D-21-77, April 1977, 299 p, 45 fig, 20 tab, Vol I of II. DOT-CG-31571-A.

Descriptors: *Accidents, *Simulation, *Spills, *Model studies, Pollution, Safety, Decision making, Planning, Dynamic programming, Regulation, *Casualty analysis, *Spill-risk analysis, *Marine safety, *Collision avoidance, Casualty reduction.

This report presents research and results in the development and demonstration of scientific methods for measuring the effectiveness of merchant marine safety programs. It provides methods of quantitatively measuring change in marine accident probability associated with specific rules and regulations. Two methods for evaluating these safety programs were employed: (1) the Quasi-Experimental Method for analysis of casualty records to assess the potential effectiveness of safety measures and to clarify the sources of collision causes; and (2) the Scenario Model for exploring ship collision risk and avoidance capabilities. When formulating the QEM, there were several underlying assumptions: both vessels are operated in a safe and prudent manner; both vessels on a potential

collision course detecr each other ahead of coming close in proximity; a passing strategy is assumed; and both make necessary maneuvers to achieve a safe passing. Based on these assumptions, collision-event sequence diagrams and safety analysis logic trees (SALT) were produced. The programs analyzed using the QEM were: bridge-to-bridge radiotelephone effectiveness; collision-avoidance radar system effectiveness; and collision causes. Human factors were cited as the most important area when reducing collision risks. The scenario model is a dynamic computer simulation of the two-ship collision situation. It expresses a mathematical relationship among diverse factors that permits some measurement of alternatives. The major conclusion was that if the speed of the erring vessel is decreased by half, 80% of the collisions in the meeting scenario could be avoided and all collisions in the overtaking scenario could be avoided. ACCOMPLISHMENT PLAN, REGION VIII, UTAH LAKE-JORDAN RIVER BASIN.
Environmental Protection Agency, Denver, CO. Region VIII.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 281, Price codes: A05 in paper copy, A01 in microfiche. December 1972. 97 p.

Descriptors: *Water quality, *Water resources development, *Water pollution, *Waste water treatment, *Utah Lake(UT), *Jordan River Basin(UT), Sewage treatment, Sludge, Industrial wastes, Residential wastes, Biochemical oxygen demand, Coliform, Dissolved oxygen, Total suspended solids, Utah, Regional planning.

The Utah Lake-Jordan River Basin encompasses the headwaters to the Great Salt Lake including all of Salt Lake and Utah Counties. The accomplishment plan covers 940 stream miles and 150 square miles of surface water. Pollution problems arise from recreational/second home developments and from major industrial dischargers like U.S. Steel. Present waste water treatment efficiency does not meet state effluent standards and generally violates instream standards. The report discusses pollutant loadings, water quality standards, and tactical solutions to pollutant problems so that water quality of the Utah Lake-Jordan River Basin can meet instream 'C' standards by June 30, 1976. Tables of basin load summaries are presented showing fifth day BOD and coliform levels, proposed decreases of these levels over fiscal years '73-'76, water quality objectives, and the year in which the minimum acceptable water quality levels are to be achieved. A chronological ordering of planned accomplishments is shown outlining specific steps EPA officials should take to insure adequate water quality in the region. Principal point source loads and locations are listed along with the type and amount of pollutant each source discharges. Tactical solutions are offered based on particular situations and problems with a timetable and manpower schedule for instituting the proposed solutions. The report finishes by listing each discharger and the schedule for pollution reduction levels required by each to meet ambient water quality standards by FY '76. (Coan-NC)

ENVIRONMENTAL RESOURCES MANAGEMENT STUDIES OF THE KISSIMMEE RIVER BADSIN,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
W. C. Huber, J. P. Heaney, P. B. Bedient, and J. P. Bowden.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 330, Price codes: A13 in paper copy, A01 in microfiche. Prepared for Central and Southern Florida Flood Control District, West Palm Beach, Final Report, May 1976. 296 p, 74 tab, 91 fig, 2 append.

Descriptors: *Water quality, *Water resources management, *Land use, *Florida, *Kissimmee River Basin(FL), *Environmental management, Land classification, Soil types, Agriculture, Soil moisture, Equitable apportionment, Drainage density, Hydrology, Agricultural runoff, Drawdown, Lakes, Swamps, Marshes, Water retention, Linear programming, Model studies.

The Kissimmee River Basin, located in the central portion of peninsular Florida between the Peace River Basin to the west and the St. Johns River Basin to the east, originates near Orlando, passes through a series of shallow lakes in its upper reaches, emerges as a channelized river south of Lake Kissimmee, and flows south into Lake Okeechobee. The report describes the transition of the Kissimmee River Basin from a status typified by natural vegetation with low intensity agriculture to one increasingly characterized by intensive agriculture and urbanization, with associated water quantity and quality problems. Management alternatives are considered in three phases: land use analysis, hydrologic and water quality analysis, and analysis of storage/treatment capabilities of natural systems. Land use changes are measured using a linear programming method which apportions land among different uses and over different soil types on basis of agricultural demands, costs and constraints; this method allows the researcher to project future land use patterns. Indices of environmental quality are measured by hydrologic and water quality responses in the river basin. Hydrologic analysis for the lower basin is performed by generating surface and subsurface runoff in the model HLAND, coupled to a Muskingum routing model for the Kissimmee River. Estimates of historical and projected quantity and quality of runoff from different land uses are offered. The relationship between drainage density and the quantity and quality of runoff is alos explored. Management for environmental quality in the last management phase--analysis of storage/treatment capabilities of the natural systems--focuses on maintaining high proportions of subsurface flow, high detention times, and upon utilization of natural marshes and swamps for water quantity and quality control. NEW ENGLAND REGION SUMMARY REPORT: SEVERE RESOURCE PROBLEMS AND RECOMMENDATIONS FOR THEIR RESOLUTION--1975 ASSESSMENT OF WATER AND RELATED LAND RESOURCES.
New England River Basins Commission, Boston, MA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-275 342, Price codes: A13 in paper copy, A01 in microfiche. Prepared for U.S. Water Resources Council, Washington, D.C., Technical memorandum 4, NER BC-77, November 1977. 309 p, 7 fig, 2 append.

Descriptors: Water quality, *Water quality control, *River basins, *Water resources, *New England, River Basin Commissions, Water consumption, Resources development, Land use, Flood damages, Eutrophication, Water supply, Interbasin transfers, Wetlands, Erosion, Water requirements, Regional planning, Resource assessment, Vessel discharges, Energy facility siting.

This report summarizes much of the work carried out through the New England Regional Assessment Program and presents the conclusions and recommendations developed in response to a final list of severe resource problems in New England. The New England Region encompasses 74,640 square miles and six states. Eighty percent of the region is forested; 10% is cropland, pasture and wetland; 5% is developed; and 5% is composed of streams and rivers. The region supports 12 1/2 million people with most of the population centers near the coast or on rivers. The report describes 23 significant environmental problems resulting from development and human activities; it outlines the objectives of government policies dealing with the problems; and offers recommendations to ameliorate the problems. The recommedations are divided into data collection needs, additional research areas, special studies and legal, institutional, and policy changes. Some of the problems are point source pollution, discharges from small vesse inappropriate land use, loss of prime agricultu land, loss of key historical and prehistorical sit and others. Tables are provided, listing the soci economic characteristics of the region, such population, total employment earnings, incom land use. Other tables list the water requiremen both withdrawal and consumptive use of fres water and saline water, for residential, industri and agricultural purposes; and flood damages a frequency of flooding. An identification and d cussion of 22 regional assessment problem areas provided with an in-depth listing of their enviro mental problems in tabular form. The proble areas are the major river basins and coastal zon throughout New England. (Coan-NC)

ENVIRONMENTAL POLLUTION CONTRO TWO VIEWS FROM THE GENERAL POPUL TION,
Kansas State Univ., Manhattan. Dept. of Politi Science.
P. Althoff, and W. H. Greig.
Environment and Behavior, Vol. 9, No. 3, p 4 456, September 1977. 2 tab, 20 ref.

Descriptors: *Attitudes, *Decision-making, *Soc values, *Pollution, *Environmental conce *Government policy, *Public opinion, Abateme Kansas, Environmental pollution control.

This study explored the opinions of a rand sample of the general population of the state Kansas concerning the environmental pollut controversy and how it should be dealt with. F clusters -- environmental concern, governmen trust, industrial trust, environmental protector, personal commitment, are formulated for the d and are used as the basis for the discussion findings. Respondents in each cluster were aske questions. Relationships between the five clust and 15 specific variables -- socioeconomic policy related issues-are presented. It was fo that the respondents were concerned about environmental issue, were not particularly trust of governmental and industrial efforts to solve pollution problem, were only somewhat dedica to environmental protection, and were relativ committed personally to aid in solving the pr lem. Those living in urban areas, who were yo ger and had higher levels of education and hig incomes tended to be more concerned about e ronmental issues, less trusting of both governm tal and industrial efforts, more personally comm ted to environmental aid in solving pollution pr lems and more dedicated to environmental prot tion than those living in small towns and r areas, who were older and had less education lower incomes. The authors indicate that the fi ings of the study may have severe implications the future of pollution control policy-maki (Arnold-NC)

RED RIVER OF THE NORTH BASIN.
Environmental Protection Agency, Denver, Region VIII
Available from the National Technical Informa Service, Springfield, VA 22161 as PB-255 Price codes: A07 in paper copy, A01 in microfi December 1972. 136 p.

Descriptors: *Water quality, *Water resources velopment, *Water pollution, *Waste water t ment. *North Dakota, *Red River of the N River Basin, *Red River Basin(ND), Colifo Biological oxygen demand, Dissolved oxygen, dustrial wastes, Total suspended solids, Sew Sewage treatment, Regional planning.

The Red River of the North River Basin enc passes portions of North Dakota, Iowa, Minnes and the Dominion of Canada. Because of River Basin involves three state governments, EPA regional jurisdictions, and the Canadian g ernment, pollution problems are extremely c plex. The area of primary effort for Region VI the State of North Dakota. The major indus pollution in the Basin stems from sugar beet

itions while other pollution problems are d by discharging wastewater effluent under esulting in high oxygen deficiences. Because dischargers release their wastes during spring all, which is also the peak time for sugar beet essing, a large slug loading is deposited upon ver system at these times. The report offers a rehensive assessment of pollutant loadings in ceiving waters in the Red River Basin and tactical solutions for what are viewed as r problems. Tables are presented showing basin loads of biological oxygen demand and suspended solids for fiscal years 1973, 1974, and 1976. Planned accomplishments are listed ronological order showing which specific ac- EPA administrators should take when solv- Red River pollution problems. A long section e report is devoted to point source loads and ions. These tables list principal dischargers, a of waste parameters and present loads of parameters, and loads for fiscal years 1973, 1975 and 1976. Also, information on the type aste treatment facility and effluent require- s is shown. The report ends by describing h actions dischargers should take to bring wastes in line with water quality standards. n-NC)

IRONMENTAL AND ECONOMIC PROB- IS ASSOCIATED WITH THE DEVELOP- NT OF THE BURNS WATERWAY BOR, INDIANA.
ptroller General of the United States, Wash- n, DC.
lable from the National Technical Information ice, Springfield, VA 22161 as PB-257 325, codes: A03 in paper copy, A01 in microfiche. ared for the Corps of Engineers, Washington, September 20, 1971. 44 p, 7 append.

riptors: *Water quality, *Industrial wastes, ter pollution, *Burns Waterway Harbor(IN), nes National Lakeshore Park(IN), Water pol- n effects, Water pollution abatement, Water ition control, Waste water pollution, Water rces development, Recreation, Transporta- Harbors, Environmental effects, Air pollu- Indiana, Economic development.

Burns Harbor Waterway is located on the e of Lake Michigan about 18 miles east of the ois-Indiana state line. The harbor is bordered he west by the Midwest Steel Division of onal Steel Corporation, and on the east by lehem Steel Corporation. The National Park ice (NPS), Department of the Interior, is ac- ng land on both sides of the harbor area for lopment of the Indiana Dunes National Lake- e Park. The report discusses the environmental economic problems associated with the devel- ent of the harbor as a transportation facility he two steel mills. It describes Indiana's air water pollution control programs and their ral inadequacy in controlling pollution in the or. The major deterrents to implementing ef- ve monitoring and control programs are the of financial resources and the need to gthen the air and water pollution control leg- on and regulations. The report also points out while control of water pollution is primarily a e responsibility, legal provisions allowing and uraging localities to establish air quality con- programs exist. Porter County, which has diction over the harbor and Dune areas, does have adequate legislation, financial resources, qualified personnel to control the problem. stions are raised concerning assurances made he State of Indiana regarding public terminal transfer facilities to be provided at the harbor. master plan showed an estimated cost of $38.6 on for these facilities. The major conclusion is pollution from existing and future develop- t in the Burns Harbor Waterway area, unless quately controlled, with have a detrimental ct upon the Dunes area. (Coan-NC)

MERAMEC RIVER, MISSOURI. COMPREHENSIVE BASIN STUDY, VOLUME III. APPENDIX B: WATER NEEDS AND PROBLEMS,
Washington Univ., St. Louis, MO.
E. L. Ullman, R. R. Boyce, D. J. Volk, and B. T. Bower.
December 1961. 230 p, 5 chapters.

Descriptors: *Water resources, *Economics, *Flood damage, *Water supply, *Water quality, *Waste water disposal, *Recreation, *Meramec River(MO), Water requirements, Missouri, Economic efficiency, Cost-benefit analysis, Economic impact, Flood control, Flood data, Flood flow, Flood forecasting, Flood frequency, Flood plains, Flood protection, Non-structural measures, Water supply development, Cities, Industries, Ground water availability, Surface water availability, Waste disposal, Recreation demand, Recreation facilities, St. Louis(MO).

This Study was undertaken to devise a program for development of the Meramec Basin's water and related land resources to meet both short- and long-term needs. This volume deals with water needs and problems, and is comprised of five distinct chapters. The first deals with methods of economic analysis. Economic assumptions and procedures used in benefit-cost analyses are reviewed. Outputs and benefits from water resource systems are outlined, with special attention given to flood damage reduction, navigation, water supply and quality, fisheries, recreation and power. Ch. 2 is concerned with flood damage reduction. Both structural and non-structural methods are reviewed, flood problems assessed, benefits from flood damage reduction estimated, and future flood damage-discharge relationships outlined. Ch. 3 discusses municipal and industrial water supply. Water supplies in both the Meramec Basin and the St. Louis area are inventoried, as are the municipal and industrial water supply requirements in both the Basin and the St. Louis area. Ch. 4 is concerned with waste disposal and water quality. Sources of pollution in the Basin are identified, water quality is assessed, and the effect of increased streamflows is reviewed. Industrial wastes are inventoried. Ch. 5 deals with recreation. National trends are discussed, followed by an assessment of the demand for water recreation in the Basin. An estimation of benefits from basin reservoirs is provided, the impact of recreation on local economies and on the St. Louis area is presented, characteristics of needed recreation facilities are discussed and recreation needs for the Basin and St. Louis are summarized. COST OF SOCIAL AND ENVIRONMENTAL REGULATIONS IN CONSTRUCTION,
Ohio Northern Univ., Ada.
E. Koehn, R. E. Benson, Jr., and D. Shank.
Journal of the Construction Division of the American Society of Civil Engineers, Vol. 104, No. 2, p 117-122, June 1978. 1 fig, 4 tab, 7 ref.

Descriptors: *Construction costs, *Pollution abatement, *Social aspects, *Regulation, *Environmental effects, *Opinion surveys, Costs, Industrial wastes, Federal government, Ohio, Construction, U.S. Environmental Protection Agency, Occupational Safety and Health Administration, Nuclear Regulatory Commission, Equal Employment Opportunity Commission.

Effects of environmental and social regulations of four governmental agencies on construction industry costs were assessed by means of an opinion survey of 400 large contractors in a list compiled by Engineering News-Record, and 476 smaller contractors listed in the Ohio Contractors Association Directory. The great majority of contractors (88% of the ENR 400 and 84% of the OCA group) said that social and environmental controls have measurable increased construction costs. About three-fourths of the respondents also felt that generally accepted construction practices satisfy requirements of the regulations. The weighted mean percentage of construction costs spent for social and environmental controls was 10.7% for the ENR 400 and 11.9% for the OCA group. The weighted and unweighted means were quite close for the ENR 400, indicating percentage allocated for controls does not vary greatly with the organizations's dollar value; this is not the case for the OCA group. A representative sample of comments taken from the questionnaires is included. Regulatory agencies considered in this paper are: the Environmental Protection Agency (EPA), Occupational Safety and Health Administration (OSHA), Nuclear Regulatory Commission (NRC), and the Equal Employment Opportunity Commission (EEOC). Costs are itemized by agency. (Lynch-Wisconsin)

AN APPROACH TO THE OPTIMAL CONTROL OF POLLUTION IN BOUNDARY WATERS,
Guelph Univ. (Ontario). Dept. of Economics.
B. A. Forster.
Discussion Paper No. 77-10. 17 p, 3 fig, 21 ref.

Descriptors: *Water pollution control, *Boundary waters, *Optimization, *Economics, *Mathematical models, *International water, Boundaries(Property), Theoretical analysis, Model studies, Dynamic models, International Joint Commission, Canada, United States, Economic efficiency, Great Lakes, History, Treaties, International waters.

An aggregate model of pollution and economic activity developed by the author in a previous paper is modified to include two countries (such as Canada and the United States), facilitating analysis of problems involving pollution in international boundary waters. It is assumed that the two countries share a common waterway, such as the Great Lakes, which is polluted as a result of normal economic activity. A Bolza-Hestenes optimal control formulation involving an isoperimetric constraint was constructed and analyzed. The resultant strategy is dynamically Pareto efficient; it is not possible to make one nation better off without making the other worse off. Redistribution which takes place in the model does not involve real productive resources in a geographical sense; each country must live within its own production constraint. Redistribution takes place through the level

of pollution in the boundary water. The model assumes each country produces a fixed flow of output. Evolution of the pollution stock depends upon the size of the waste flow and the assimilative capactity of the waterway. A decay function is included. The Canadian-American International Joint Commission was established following signing of the Boundary Waters Treaty by Britain and the U.S. in 1909 (ratified by Canada in 1911). The IJC's initial focus on efficient use of boundary waters shifted in 1912 to concern for pollution. In 1972 the Great Lakes Water Treaty was signed. (Lynch-Wisconsin)

INACTIVE AND ABANDONED UNDERGROUND MINES. WATER POLLUTION PREVENTION AND CONTROL,
Baker (Michael), Jr., Inc., Beaver, PA.
R. L. Scott, and R. M. Hays.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 263, Price codes: A14 in paper copy, A01 in microfiche. Report No. EPA-440/9-75-007, June 1975. 293 p, 54 fig, 14 tab, 132 ref. 68-01-2907.

Descriptors: *Water pollution control, *Mine drainage, *Underground structures, *Acid mine water, Water quality control, Pollution abatement, Water pollution sources, Costs, Mineral industry, Mine wastes, Mine water, Metals, Nonmetals, Coal, Thorium, Uranium.

The chemistry and geographic extent of mine drainage pollution in the U.S. from inactive and abandoned underground mines is discussed; underground mining methods are surveyed. Mine drainage control technology, largely developed in eastern U.S. coal fields and not always applicable to other regions and other mineral mining, are classified into two main categories: (1) at-source and (2) treatment. At-source mine drainage pollution prevention and control techniques are evaluated and described according to the following classifications: water infiltration control; mine sealing; mining techniques; water handling; and discharge quality control. Appropriate cost data is related, examples technique implementation are given. A summary of the mineral commodities mined in the U.S. includes location and the environmental effects associated with mining them. An extensive bibliography is provided. (Davison-IPA)

CONTINGENCY PLAN FOR CONTROL AND TREATMENT OF ACCIDENTAL SPILLS OF TOXIC CHEMICALS FROM ELECTROPLATING PROCESSES,
Army Materiel Command, Texarkana, TX.
R. A. Raby.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A009 197, Price codes: A03 in paper copy, A01 in microfiche. Final Report No. USAMC-ITC-02-08-75-216, March 1975. 45 p, 3 fig, 1 tab, 11 ref, 1 append.

Descriptors: *Spills, *Waste treatment, *Water pollution control, Toxicity, Industrial wastes, Liquid wastes, Water pollution treatment, Neutralization, Oxidation, Chemical reactions, Cyanide, Acids, Red River Army Depot, Texarkana, Texas.

Methods for treating spills of three types of electroplating process solutions are evaluated. Results of experiments using ferrous sulphate and sodium metabisulphate to treat hexavalent chrome verify their effectiveness. Treatment of cyanides by catalytic oxidation and alkaline chlorination yielded satisfactory results. Acids were neutralized with hydrated lime, soda ash, and caustic soda. A contingency plan for the electroplating shop at Red River Army Depot in Texarkana, Texas, to detect and treat spills is presented; a general discussion of this shop is included. (Davison-IPA)

An assessment of the continuing research and velopment work in the field of coal-fired uti power plant flue gas cleaning (FGC) waste tr ment, disposal, and utilization is presented. Ove power plant water recycle and reuse is include the assessment. Results from 19 projects cover following: (1) chemical and physical character tion of wastes from eastern and western U.S. pl using lime, limestone, or double-alkali scrubb systems; (2) chemical and physical properties leaching characteristics of treated and untrea wastes; (3) field evaluations of treated and untr ed waste disposal; (4) disposal and utilization al natives; (5) cost estimates for ponding and fixation disposal methods; (6) disposal standa (7) gypsum production and marketing; (8) poten use of wastes in fertilizer and portland cem production; and (9) beneficiation studies. The sults from this program will be used to provid data base for defining waste disposal standards predicting effects on ground and surface w quality. (Davison-IPa)

ALUATION OF SOURCES OF ODOR POL- TION IN AN AREA OF KANSAS CITY, MIS- URI.
dwest Research Inst., Kansas City, MO.
ailable from the National Technical Information rvice, Springfield, VA 22161 as PB-259 868, ce codes: A03 in paper copy, A01 in microfiche. al Report, 1974. 41 p, 4 fig, 11 tab. 3701-C, 68- 0453.

scriptors: *Air pollution, *Pollutant identifica- n, *Odor, Industrial effluents, Laboratory tests, s chromatography, MRI Fingerprint method, mpling, Analytical techniques, Urban areas, Air vironment, Air pollution effects, Kansas City, ssouri.

evaluation of potential odor sources in Kansas y, Missouri, was accomplished by utilizing the dwest Research Institute 'fingerprint' method. e 'fingerprint' method involves: (1) collection of oncentrated sample of the volatile contents pres- in the air during an odor episode; (2) collection samples in the air upwind and downwind of h potential odor source; and (3) separating the nstituents of each sample by gas-liquid chroma- graphy (GLC). Flame ionization detection was d with GLC separation. The best separation s obtained by SF-96 and FFAP columns. Back- ound samples and source samples were collected m five potential odor sources. Source sample alyses were compared with background sample alyses to identify the specific sources of the odor mplaints. One complaint sampling contained ef- ent from four sources; the major contributions re Chemagro Corporation and Conservation emical Company. In all odor episodes analyzed, se two companies were the major contributors; luent from American Oil Corporation was a nor contributor during one episode. (Davison- A)

ETHANOL TREATED ACTIVATED SLUDGE S AN AGRICULTURAL CHEMICAL CARRI- R,
epartment of Agriculture, Washington, DC.
ne 17, 1976. 34 p, 13 tab.

escriptors: *Agricultural chemicals, *Chemcon- ol, *Application method, *Activated sludge, Pes- cides, Fertilizers, Plant growth regulators, Water llution control, Sprays, Granules, Seed treat- ent, Soil treatment, Methanol, Sludge.

A method for the controlled, sustained release of agricultural chemicals to their target organisms is described. The method employs a methanol treated activated sludge carrier, and has application in forming sprayable films, granular pellets, and seed coatings, resistant to the natural mechanisms of chemical loss. Pesticides and fertilizers, normally applied directly to the soil, plant foliage or an inert carrier are particularly suitable for use with this method. (Davison-IPA).

GUIDANCE FOR PREPARING A FACILITY PLAN, MUNICIPAL WASTEWATER TREATMENT WORKS, CONSTRUCTION GRANTS PROGRAM,
Environmental Protection Agency, Washington, DC. Municipal Construction Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 652, Price Codes: A04 in paper copy, A01 in microfiche. Report No. MCD-46, May 1975. Supercedes 'Guidance for Facilities Planning, 'January 1974. 62 p, 26 ref, 3 append.

Descriptors: *Waste water treatment, *Treatment facilities, *Municipal wastes, *Federal Water Pollution Control Amendments, *National Environmental Policy Act, Planning, Legal aspects, Publications, Regulation, Grants, Government finance, Design criteria, Cities.

Suggested procedures for preparing a facility plan for publicly-owned treatment works are presented. This plan is the first stage in a three stage process required of a municipality desiring a Federal grant under the Federal Water Pollution Control Amendments of 1972 (FWPCA) to construct a treatment works. Requirements and regulations contained in the two major laws, FWPCA and the National Environmental Policy Act (NEPA), are described. The following areas are discussed in detail: (1) facility plan; (2) public participation; (3) evaluation of costs; (4) environmental evaluation; (5) plan selection; (6) format for plan submission; and (7) review, certification and approval of plans. The construction grant regulation is provided in appendix B. (Davison-IPA)

ALTERNATIVE INSTITUTIONAL AND FINANCIAL ARRANGEMENTS FOR AREAWIDE WASTE TREATMENT MANAGEMENT,
Banks (Harvey O.) Consulting Engineer, Inc., Belmont, CA.
H. O. Banks, and H. J. Owen.
Available from the National Technical Information Service, Springfield, VA. as PB-253 318, Price Codes: A 08 in paper copy, A01 in microfiche. January 1974. 175 p, 2 fig, 5 tab, 105 ref, 2 append. 68-01-2909.

Descriptors: *Waste treatment, *Project planning, *Financing, *Management, Water quality, North Carolina, Ohio, Maine, Water resources development, Comprehensive planning, Regional development, Water law, Water requirements, Water Quality Control Act.

Results of a study to identify and describe components inherent in selecting institutional and financial arrangements which might be used in implementing areawide waste treatment management plans are reported. The related tasks of the study included a literature review, case study investigations, a comparative analysis of the case study findings, and the preparation of recommendations. The case study areas selected represent a wide range in the following: water quality problems to be solved, existing institutional framework, geographic location, and character of the planning area. It was generally concluded that adequate information can be obtained at the inception of the planning process to identify the depth and detail of institutional and financial studies requisite to developing areawide waste treatment management plans. Thrity general conclusions and recommendations, for the case study areas are presented. Institutional and financial aspects of areawide waste treatment management are detailed and case studies invoving the areas of Youngstown, Ohio, Raleigh - Durham, North Carolina, and Southern Maine are reported. OIL BOOM,
British Petroleum Co. Ltd., London (England). (Assignee).
M. G. Webb.
U.S. Patent No. 4,112,689, 5 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 974, no 2, p 624, September 12, 1978.

Descriptors: *Patents, *Oil pollution, *Oil spills, *Water pollution control, Water quality control, Barriers, Floating, Weirs, Equipment, *Oil booms, Containment(Wastes), Oil recovery.

A barrier for the containment and recovery of oil spilt on water comprises at least one elongated, flexible buoyant chamber, at least one elongated, flexible ballast water chamber and at least one further flexible water chamber of greater buoyancy than the ballast chamber. The buoyant chamber and the further water chamber are each joined to the ballast water chamber in side by side relationship and the chambers are so positioned relative to one another that when in use on water the buoyant chamber and the ballast water chamber together form a barrier for oil spilt on water. The further water chamber defines a weir between itself and the other chambers and the weir is provided with means to remove oil and water. (Sinha - OEIS)
W79-03311

APPARATUS FOR SEPARATION OF OIL FROM OIL AND WATER MIXTURES,
Simon-Hartley Ltd, Stoke-on-Trent (England).
K. H. Toft.
U.S. Patent No. 4,115,279, 4 p, 4 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 974, No. 3, p. 1492, September 19, 1978.

Descriptors: *Patents, *Oil pollution, *Oily water, *Water pollution treatment, Water quality control, Separation techniques, Laminar flow, Equipment, Ballast water.

An apparatus separates oil from a mixture of oil and water. A stream of the mixture is directed along an upwardly inclined inverted channel. The apparatus is designed to direct the intended rate of flow of liquid to ensure that liminar flow takes place. As the mixture flows upwardly globules of oil form, float to engage the under-surfaces and become trapped in the apices of the inverted channels and thus are separated from the remainder of the stream. The length of the structure is such as to ensure that substantially all the oil contained within the mixture is separated by the time the mixture reaches the upper end. The oil is collected from the upper longitudinal end of the channel and the remainder of the stream is allowed to fall downwardly out of the channel. (Sinha - OEIS)
W79-03327

DEPLOYABLE BARRIER APRON APPARATUS FOR USE WITH CONTAMINANT RECOVERY SYSTEMS,
Oil Spill Recovery, Inc., Northbrook, IL. (Assignee).
M. D. Stagemeyer.
U.S. Patent No. 4,116,007, 7 p, 10 fig, 5 ref; Official Gazette of the United States Patent Office, Vol. 974, No. 4, p. 1758, September 26, 1978.

Descriptors: *Patents, *Oil pollution, *Oil spills, *Barriers, Water pollution control, Water pollution treatment, Water quality control, Floating, *Containment(Wastes), Contaminant recovery, Deployment.

A readily deployable barrier apron is used with contaminant recovery systems to encompass contaminant material or to channel such material to collection devices. An upper apron member which is impenetrable has a lower penetrable member attached. Deployment devices such as hinging segments or spooling rolls of such apron barrier are utilized with an uprighting construction to provide for a quickly deployable, ready to use, and easy to control barrier construction for such uses as the containment of oil spills. (Sinha - OEIS)

W79-03329

METHOD AND APPARATUS FOR REMOVING CONTAMINANTS FROM BODIES OF WATER,
Oil Spill Recovery, Inc., Northbrook, IL. (Assignee).
M. D. Stagemeyer, and S. F. Allcorn.
U.S. Patent No. 4,116,833, 11 p, 16 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 974, no 4, p 2030, September 2€, 1978.

Descriptors: *Patents, *Oil spills, *Skimming, *Barriers, Water quality control, Water pollution treatment, Equipment, Contaminant recovery, *Oil pollution.

A method and apparatus for removing petroleum and other spilled contaminant materials from the surface of a body of water is described. An open-ended barricade is directed into and about a contaminant mass to channel the contaminant material to skimming apparatus which assists in collecting the material for recovery, storage and reuse. The process and apparatus is especially adaptable for use in naturally flowing bodies of water into which the apparatus is restrainably positioned to continuously and automatically remove the contaminant material. By maneuvering the outermost ends of the barricade, it can be formed into funneling means for converging the material toward the collection area. (Sinha - OEIS)
W79-03332

POLLUTION CONTROL SYSTEM,
Savage Technical Services, Inc., Clark, NJ. (Assignee).
A. B. Bertelson.
U.S. Patent No. 4,116,835, 7 p, 4 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 974, No 4, p 2031, September 26, 1978.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Oil pollution, *Water pollution treatment, Separation techniques, Coalescence, Adsorption.

Oil and other contaminants are separated from aqueous effluents by a system which includes means for introducing the contaminated effluents into a separation zone where they are passed through the labyrinth course of a coalescing chamber to separate oil particles. The oil is removed by means of a skimmer and moved into an oil storage area. The aqueous effluents are then passed from the bottom of the separation zone to an extraction zone where they are passed through a bed of a material capable of adsorbing hydrocarbons and other pollutants. The effluent may then be discarded or may be moved through a fail safe system designed to assure that hydrocarbon removal is complete in all instances. (Sinha-OEIS)

MECHANICS OF A RESTRAINED LAYER OF FLOATING OIL ABOVE A WATER CURRENT,
Massachusetts Inst. of Tech., Cambridge.
J. H. Milgram, and R. J. Van Houten.
Journal of Hydronautics, Vol 12, No. 3, p 93-108, July 1978. 20 fig, 1 tab, 15 ref.

Descriptors: *Oil pollution, *Barriers, *Shear stress, *Currents(Water), Water pollution effects, Oil-water interfaces, Outer Continental Shelf, Water currents, Dynamic pressure.

The relative importance of interfacial shear stress and dynamic pressure in determining the thickness distribution of a layer of floating oil contained by a barrier above a water current is determined. This is done by use of an equation relating vertical location of the oil-water interface, dynamic pressure, and shear stress. The interfacial shape is measured experimentally. The dynamic pressure is determined by numerical solution of the potential flow problem for flow beneath the measured shape. The aforementioned equation then yields the shear stress distribution. The rear portion of restrained oil layers are found to governed by shear stress as are the forward portions for low current speeds. At higher current speeds, both dynamic pressure and shear stress are important in determining the shape of the forward portions. Large friction coefficients are shown to be due to flow over a rough interface resulting from the generation of Kelvin-Helmholtz waves on the interface. The entrainment of oil droplets into the water flow is shown to be the result of breaking of the Kelvin-Helmholtz waves. (Sinha-OEIS)

APPLICATIONS OF SEASAT TO THE OFFSHORE OIL, GAS, AND MINING INDUSTRIES,
Battelle Columbus Lab., OH.
A. G. Mourad, and A. C. Robinson.
Journal of Hydronautics, Vol 12, No 4, p 137-141, October 1978. 1 fig, 1 tab, 8 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *Oil spills, *Mining, Gases, Water pollution, Resources development, Environmental effects, Monitoring, *Outer Continental Shelf, *Seasat-1, Offshore industries.

Seasat-1, a NASA satellite launched in June 1978, was designed to provide synoptic, repetitive data on the ocean areas of the world. Seasat-1 carries five sensors, four with all-weather capability. The principal data products will be surface wind speed and direction, ice characteristics, and ice movement. One of NASA's objectives is to demonstrate Seasat capability and to permit evaluation of the practical value of the data to offshore industry users. Thus, this paper describes several industrial experiments planned by NASA during the operation of Seasat-1. These experiments are to be conducted with several industries, including oil, gas and mining organization which will be investigating the usefulness of the data. Applications include (1) improvements in weather and wave forecasts, (2) improved knowledge of past wind and wave statistics for setting design requirements, and (3) monitoring ice formation, breakup, and movement in arctic regions. A number of geographical areas are being examined, including the Beaufort Sea, Labrador Sea, Gulf of Mexico, U.S. East Coast, West Africa, Equatorial East Pacific, Bering Sea, and the North Sea. These investigations are being done jointly by NASA and the participating industrial organizations. NASA will provide the appropriate Seasat-derived data, and the industrial organizations will compare these data with their own observations and estimate the usefulness to offshore operations. Results will be available to the entire offshore industry and to the general public once the evaluations are completed. (Sinha-OEIS)

APPLYING THE CLEAN WATER LAW TO SOUTHEAST FORESTRY,
Soil Conservation Service, Atlanta, GA.
A. J. Dornbusch, and A. B. Herndon.
Southern Journal of Applied Forestry, Vol. 2, No. 1, p. 74-77, August, 1978. 1 fig, 4 ref.

Descriptors: *Water law, *Forestry, Water pollution, Forest management, Federal water pollution control act, Legislation, Water quality act, United States.

Control of any water pollution from forest management is required by the Federal Water Pollution Control Act (PL 92-500). Voluntary programs are acceptable in the Southeastern United States. Plans developed under Section 208 of the Act must include best land management practices, priorities, implementation schedules, evaluation programs, and reporting systems. A key factor is the assessment of types and locations of any water quality problems. Failure of voluntary plans after several years trial may require regulatory approaches to be taken. (Witt-IPC)

IMPROVE IRRIGATION RETURN FLOW QUALITY WITH A WATER RENTAL MARKET,
Colorado State Univ., Fort Collins. Dept. of Economics.
P. C. Huszar, and M. B. Sabey.
Water Resources Bulletin, Vol. 14, No. 4, p 978-987, August 1978. 3 fig, 1 tab, 5 ref.

Descriptors: *Irrigation, *Return flow, *Rental market, *Water quality, *Improvement, *Yakima River valley(Wash), Water allocation(Policy), Crop production, Economic efficiency, Water pollution, Water rights, Linear programming, Mathematical models, Benefits, Costs, Supply schedule, Opportunity costs, Water transfer, Systemsanalysis, Washington.

Current policies for correcting the problem of irrigation return flow pollution tend to attack the symptoms of the problem, rather than its cause. The present institutional arrangement for allocating irrigation water is seen as the source of the problem. This paper examines the water quality benefits of altering the institutional arrangement to allow for irrigation water transfers through a rental market. It is conceptualized that by creating a water rental market, an opportunity cost would be associated with the use of irrigation water such that profit maximizing farmers would be induced to use their water supplies more efficiently and rent the surplus to other irrigatiors, thus reducing return flow pollution. It is shown that a water rental market could improve water quality in the Yakima River in southcentral Washington by 31 percent as well as increase farm incomes and crop production. (Bell-Cornell).

D. T. O'Laoghaire.
Water Resources Bulletin, Vol. 14, No. 4, p 809-826, August 1978. 1 fig, 4 tab, 34 ref.

Descriptors: *Water quality, *Management, *Optimization, *Algorithms, *Capacity expansion, *Cost minimization, Capita costs, Investment, Linear programming, Integer programming, Operating rules, River basins, Computer programs, Constraints, Dissolved oxygen, Treatment facilities, Equations, Mathematical models, Systems analysis, Developing countries.

Described is a mathematical model, an algorithm, and a computer program that were specially developed to study the problem of a water quality management system undergoing a rapidly increasing environmental stress. The model output will determine the locations, sizes and timing of construction of new treatment plants plus an overall treatment plant operating policy so that environmental standards are maintaned at a minimum cost. The model, as formulated, is a 0-1 mixed integer programming problem which is solved by decomposing it into a capital budgeting problem (solved by Little's branch and bound algorithm) and an operational policy problem (solved by linear programming). The coded algorithm (in FORTRAN 10) has been tested with a semi-realistic example. (Bell-Cornell)

OPTIMIZATION MODEL FOR THE EVALUATION OF FLOOD-CONTROL BENEFITS OF MULTIPURPOSE MULTIRESERVOIR SYSTEMS,
Texas Univ. at Center for Research in Water Resources.
D. T. Ford.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 638, Price codes: A11 in paper copy, A01 in microfiche. Publication No 158, 1978. 247 p, 25 fig, 10 tab, 4 exh, 62 ref, 4 append. OWRT C-6268(5224)(1).

Descriptors: *Flood control, *Economic evaluation, *Systems analysis, Estimated benefits, Reservoir storage, Reservoir releases, Reservoir operation, Multiple-purpose reservoirs, Water management(Applied), Frequency analysis, Optimization, Operations research, Network flow programming, *Arkansas River system.

A methodology is described for quantifying the demand for flood-control in a multipurpose reservoir system and for evaluating the expected benefits of satisfying that demand as a function of beginning-of-period storage, thereby permitting analysis of multipurpose operation with a suitably long computation interval. The methodology is executed in three major steps: (1) analysis of the frequency of natural flows and evaluation of the associated damages to develop damage frequency curves, (2) evaluation of the frequency of damages inccurred by regulated flows for various states of system storage via application of an operation optimization model, and (3) integration of the resulting damage frequency curves to determine the expected flood-control benefits. The optimization model used is a linear programming model, formulated with emphasis on selection of operation rules that are acceptable in practice. Specific limitations imposed on flood-control operation of reservoirs by the Corps of Engineers are incorporated explicitly in this model, both as constraints and as terms of the objective function. Additional goals and priorities of operation are specified with penalty coefficients in the objective function. A special case of the linear programming model, the network flow programming model, is presented, and its application is discussed. The benefit evaluation methodology is demonstrated by application to reservoirs of the Arkansas River system. Additional applications of the benefit evaluation methodology and the operation optimization model are suggested. Modifications and improvements are proposed.

Ecological Modelling, Vol. 5, No. 1, p 39-66, June 1978. 8 fig, 3 tab, 37 ref.

Descriptors: *Model studies, Hydrology, *Water quality, *Optimization, *Simulation analysis, Systems analysis, Dynamic programming, Linear programming, Mixed-integer programming, Flow, Planning, Stochastic processes, Macro-elements.

Summarized is the 'state-of-the-art' of concepts and applications in the international development of water quality and hydrology modeling. Study information was obtained from publications, project reports, personal interviews, and discussions. Investigated were 41 models from 11 different countries, 20 emphasizing hydrological aspects, 18 focussing on water quality, and 3 incorporating both hydrology and quality. Established were general principles of model analysis for comparison and presentation. So-called 'macro-elements,' comprising input, systems analysis formulation, algorithm, and output were identified. 'Micro-elements' were defined, denoting typical analytical units within the models. Part A of the report focusses on hydrological models; introduced were three model classes, according to purpose, data requirements, and model structures, viz.: computation of runoff data; optimal operation of regional water resources systems; and optimization of the design of hydraulic structures. In part B, focussing on water quality, the more traditional approach of a descriptive analysis of the self-purification process in rivers were explored in several directions. Considered were: data fitting of lump-sum observations; detailed empirical formulation of processes; food-chain simulation; and stochastic water quality analysis. Formal optimization routines employed in quality control emphasize linear, mixed-integer, and dynamic programming, the trend showing a desirable feedback between optimization and simulation. Mathematical modeling of hydrological and water quality phenomena has become an indispensable tool for environmental control and enhancement. (Bell-Cornell)

Descriptors: *Alternative planning, *Evaluation, *Regional analysis, *Water supply, *Supply function, *Cost minimization, Constraints, Water demand, Methodology, Linear programming, Nonlinear programming, Equations, Mathematical models, Systems analysis, Marginal cost.

Considered is a method to evaluate water supply alternatives in a region and to appropriately combine them to meet projected water demands. A useful extension of physical system analysis utilizes water supply functions, which give the amounts of water that could be made available at various cost increments. Considered first is the problem of developing a general scheme for water supply in a particular region. Next, the key idea in deriving a supply function, different supply alternatives, and the resource inputs required for each, are substituted for each other until the least-cost combination for producing any desired amount of water is found. The standard formulae for input demand are deduced and the marginal cost derived. Provided is a methodological framework for finding water supply functions through a nonlinear program. However, in many practical situations, it is reasonable to have the application of the methodology in the form of a linear program. Work in this area could benefit from considering how to introduce nonlinearities, especially those resulting from economies of scale, in as painless a fashion as possible. The dynamics of water supply need to be considered. (See also W79-03083) (Bell-Graf--Cornell)

OPTIMAL PLANNING FOR URBAN STORM DRAINAGE SYSTEMS,
Purdue Univ., Lafayette, IN. School of Civil Engineering.
S. A. Dendrou, J. J. Talavage, and J. W. Delleur.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers. Vol 104, No. WR1, November 1978. p 17-33, 5 fig, 2 tab, 16 ref, append. OWRT B-083-IND (9).

Descriptors: *Urban drainage, *Drainage systems, *Storm drains, Storm runoff, Urban hydrology, *City planning, *Optimal development plans, *Indiana, LANDSTORM, URBDRAIN, LANDUSE, *Optimization.

A watershed in an urban area may be partitioned into subbasins, each of which is a tributary to a downstream subbasin or to a receiving water body. The planning of a storm drainage system for such a watershed according to the requirements of Section 208, PL 92-500, can be efficiently accomplished by coordination of the interactions among the subbasins. A model for these interactions is presented and implemented in the urban storm drainage planning model URBDRAIN. The planning variables in the model are maximum convey

; capacities of the drainage network, placement
d size of detention storage facilities, and size of a
ntral treatment facility. A two-level optimization
ution procedure is shown which provides mini-
l-cost values for the planning variables. An ex-
ple application is shown for a medium size
mmunity in Indiana.

computer program package is developed that
tegrates and interfaces an urban growth simula-
n model, LANDUSE, and an urban hydrology
odel, a modified version of STORM. Alternate
owth scenarios can thus be directly related to
e corresponding storm-drainage systems. If these
stems are designed to achieve specified standards
performance, then a useful comparison among
veral possible urban growth patterns can be per-
rmed. While an urban area encompasses several
tural watersheds, the hydrologic models simu-
te one watershed at a time. The different water-
eds that partition an urban agglomeration create
tree-like or dendriform configuration. The plan-
ng of a global storm drainage system for such a
nglomerate of basin can be efficiently accom-
ished by a coordination of the interactions
nong the different basins. A model for these
teractions is developed. The planning variables
e the drainage network capacity, the placement
d size of the storage facilities, and the size of a
ntral treatment facility. An example of applica-
n is shown for a medium size community in
diana.

A NEW APPROACH TO URBAN WATER RESOURCES SYSTEMS OPTIMIZATION,
Illinois Univ. at Urbana-Champaign. Hydrosystems Lab.
D. R. Maidment, and V. T. Chow.
In: The Environment of Human Settlements: Human Well-being in Cities, Proceedings of the Conference held in Brussels, Belgium, April 1976, p 249-259, 1976. 3 fig, 26 ref, Pergamon Press, England. OWRT B-084-ILL(3), 14-31-0001-4080.

Descriptors: *Optimization, Planning, Operations research, Systems analysis, Model studies, *Urban water resources systems, Urban population.

The modern concept of urban water resources planning is to formulate the problems as hydroeconomic systems and then to optimize the systems using operatons research techniques. A new approach to this optimization based on state variables is developed for urban water resources systems. The application of this approach to urban hydrologic problems is outlined and illustrated with an example. The incorporation of state variable models of the systems into procedures for determining the design and operational policies for urban water facilities is discussed.

Descriptors: *Sampling, *Spatial distribution, *Methodology, *Rhyolite Canyon Watershed(AZ), *Cluster analysis, *Resource management, Analytical techniques, Natural resources, Arizona, Chiricahua National Monument(AZ), National Monuments, Computer programs, Forecasting, Decision making, Planning, Computer models, Model studies, Baseline studies, Cost-effectiveness, Economic efficiency, Dendrograms.

Data-intensive sampling and multiple simultaneous hierarchical cluster analyses were combined into a total methodology to develop a computerized natural resources information system for the Rhyolite Canyon watershed, later to be extended to the entire Chiricahua National Monument, Arizona. The system predicts consequences of management decisions on the resource base. The method relies on existing computer software capabilities, and represents a significant breakthrough in cost/time efficiency in the production of an operational natural resource data base. Although total costs, manhours, and computer time are reduced to a minimum, the system produces two- and three-dimensional computer graphic displays representing several hundred individual pieces of natural resource information. The clustering program CLUSTAN was chosen for the cluster analyses. The polythetic agglomerative strategy of clustering joins individuals or groups together (agglomerative) on the basis of their similarity among several variables (polythetic). Results are displayed in the form of dendrograms, with individuals arrayed along the horizontal axis and similarity decreases on the vertical axis. Dendrogram interpretation showed elevation, slope, and vegetation type and density to be 'indicator' data types, with all remaining data types linked to these four, the only ones entered and stored. Costs and time are economized, while sacraficing neither accuracy nor specificity. (Lynch-Wisconsin)

Completion report, December 1978. 624 p, 22 fig, 76 tab, 15 append. OWRT B-025-SDAK(1). 14-01-0001-3648.

Descriptors: *Irrigation, *Recreation, *Economic impact, *River basin development, Social impact, Employment, Population, Income, *South Dakota, *Missouri River, Reservoirs, Dam construction.

Information is provided about local economic impacts that resulted from construction of the four mainstem dams along the Missouri River within South Dakota and that have been brought about within the state by recreational and irrigational uses of reservoirs impounded by these dams. Findings are based upon analyses of data obtained from published sources and agency records. Economic impacts were estimated upon selected counties adjacent to the reservoirs, separate reservoir regions, and upon the entire reservoir region. The type of impacts studied were: effect upon population levels, total personal income, per capita income, personal income received by employees within specific industries or sectors and the number of employees and establishments within these industries or sectors. Pennsylvania State University, Research Publication 101, October 1978. 246 p, 4 fig, 4 tab, 668 ref, 2 append. OWRT A-033-PA(2). 14-31-0001-5038.

Descriptors: *Standards, *Recreation, *Pennsylvania, *Watersheds(Basins), Land use, Surface waters, Vegetation, Meteorological data, Wildlife, *Outdoor recreation planning, *Recreation activities, Kinetic recreation, Harvest recreation, Beach swimming, Family camping.

In Phase II a typology of activities was developed which included three major divisions: kinetic recreation, situation-oriented recreation, and 'harvest' recreation. Each of the three divisions has been subdivided into three categories with primary orientation of land, water, or air, but with the situation-oriented division also having an educational enhancement category. Also, as part of the typology phase of the study, characteristics of users and classification of activities by characteristics and by nature of user experiences have been identified and synthesized. A conceptual model for planning purposes based on the development of resource requirements determinants for selected activities was structured in Phase III. A resource descriptor classification system was established. It was structured around commonly accepted significant conditions and supplemented with additional natural conditions considered important. The master list of descriptors included 77 descriptors divided into five categories: land, surface water, vegetation, meteorological, and wildlife descriptors. The model was tested for beach swimming at four Pennsylvania State Parks and for family camping at two. An activity analysis of the two activities as well as the details on the indicators of land-use capabilities are presented. (See also W77-05484) (Sink-Penn State)

EVALUATION OF ALTERNATIVE STORMWATER MANAGEMENT POLICIES,
Maryland Univ., College Park. Dept. of Civil Engineering.
R. H. McCuen, and G. E. Kamedulski.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 736, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Research Center, University of Maryland, Technical Report No 50, October 1978. 12 p, 6 tab. OWRT A-047-MD(1). 14-34-0001-8022.

Descriptors: *Stormwater management, Detention storage, Urban hydrology, *Evaluation, Water quality, Sediment control, *Alternative planning, *Water policy, Storm runoff.

Stormwater management is recognized as a requisite to controlling storm runoff from developing areas. To best meet societal needs, numerous policies have been adopted to meet the intent of stormwater management. Unfortunately, many policies are deficient in their failure both to lead to designs that meet the intent of stormwater management and to provide the proper guidelines for translating policy into a design that provides the maximum benefit to society. Specific deficiencies of many policies include: (1) the use of a single frequency; (2) neglect of storm duration; (3) inadequate consideration of maintenance; (4) insensitivity to the importance of soil characteristics; (5) lack of recognition of differences between water quantity and quality control; and (6) lack of consideration of downstream effects of detention storage. The effects of these policy deficiencies were evaluated.

SOME THEORETICAL AND MEASUREMENT ISSUES IN ECONOMIC ASSESSMENT OF INTERBASIN WATER TRANSFERS,
California Univ., Berkeley.
A. C. Fisher.
Water Supply and Management, Vol. 2, No. 2, p 137-145, 1978. 10 ref.

Descriptors: *Economics, *Assessment, *Interbasin transfer, *Water resources, *Environmental effects, *Cost-benefit analysis, Regional analysis, Systems analysis, Equations, Impact analysis, Environmental costs, Uncertainty, Irreversibility, Sequential model, Investment.

Tremendous increases in the size and cost of recently proposed interbasin water transfers (IWT's) ncessitate careful consideration of their economics. Offered are critical remarks concerning concepts and measurement techniques for assessing the costs and benefits of IWT's. The remarks fall into three categories: (1) methods of measuring conventional economic costs and benefits; (2) the introduction of environmental effects; and (3) special problems posed by the very long-lasting and uncertain consequences--including those to the environment--of the IWT projects. The current 'best practice technology' for assessing the impact of an IWT on a region's economy is input-output analysis. This method does not represent an advance over simpler alternative methods of regional impact analysis. Proposed is the use of an econometric modeling technique that can account--as input-output analysis does not--for both changes in the structure of the impacted region's economy and the time periods required for these changes to work themselves out. However, an IWT is virtually certain to have an impact--quite possibly adverse--on the environment that is not reflected even in the most sophsticated econometric analysis. Discussed is how the impact can, in principle, be incorporated into the benefit-cost analysis. Moreover, very long time spans and problems of uncertainty are not tractable to conventional benefit-cost analysis. The interaction between uncertainty and irreversibility (of a project's effects) have some rather sharp qualitative implications for policy. It is difficult to make any quantitative assessment of the 'option value' of deferring. (Bell-Cornell)

G. Aron, and S. P. Coelen.
Available from the National Technical Informati Service, Springfield, VA 22161 as AD-A045 1 Submitted to U.S. Engineering Institute for Wa Resources, Fort Belvoir, VA, IWR Contr Report 77-4, July 1977. 198 p., 32 fig., 23 t DACW31-75-C-0018.

Descriptors: *Water supply, *Marginal co *Average costs, *Water supply developme *Inter-basin transfers, *Regional developme *Regional water supply, *Regionalization, Wat Reservoir yield, Water resources, Reservoir st age, Economies of scale, High flow skimmi Reservoir enlargement, Time series analysis.

This report seeks to evaluate the belief that regi alization of water supply in the U.S. is a key fac in solving problems of water supply and wa treatment. A brief history of regionalization tempts in the U.S. and causes for failure are c cussed. Most regionalization plans have failed b because of political and institutional constrai and because problems of efficiency and equ were not resolved. The feasibility of regionali tion of water supply and waste disposal system then discussed. The report examines economies scale with respect to storage reservoirs, treatm facilities, well construction, transmission pipel construction, pumping operations, and others. C curves are presented for all operations, but o storage reservoirs and treatment facilities offe any kind of economy of scale. The Centre Reg around State College, PA was chosen as a c study site for the micro-scale study phase, an comparison of costs of local versus regionali water supply systems was conducted. Methodol ical tools were developed for estimating firm yie from reservoirs and expected shortages given lo term average streamflow and specific wa demand for local and regional water systems. critical look is taken at interbasin water trans and its problems. It is concluded that there is li economy of scale when water supplies are dev oped from groundwater sources. Also, any gi water supply (sewage) project can produce dis butional consequences which may cause reject of regional plans. (Coan-NC)

SUSQUEHANNA RIVER BASIN STUDY: SU MARY.
Susquehanna River Basin Study Coordinati Committee.
Available from the National Technical Informati Service, Springfield, VA 22161 as AD-A043 8 Price codes: A08 in paper copy, A01 in microfic June 1970. 168 p, 27 tab, 56 fig. See also Supp ments A and B.

Descriptors: *Comprehensive planning, *Water sources development, *River basin developme *Susquehanna River, Chesapeake Bay, Land sources, Land management, Watershed mana ment, Recreation, Water supply, Water quali Flood control, Short-term planning, Long-te planning, Administration, Coordination, Legi tion, Political aspects, Governments, Economic ficiency, Investment, Economic justification, E nomic impacts, Water policy, Needs assessme Implementation.

This volume is a summary of the comprehens plan for the development of water and related l resources of the Susquehanna River Basin. T objectives of the study were to evaluate the wa resources potential of the basin, to determine water resource requirements of an increasing po lation, to analyze alternative solutions, to rec mend management programs and to preserve high natural values of the basin for the use present and future generations. In the first chapt the basin's needs are outlined: water quality, rec ation, water supply, flood control, land mana ment, electric power, streambank stabilization erosion control. The plan for the Susquehanna reviewed, implementation suggestions are prese ed and policy recommendations made. The sec chapter deals with the basin's environment— physical and human landscapes and man's imp on the basin's water and land resources. Exac how the plan will affect the four major needs

ter quality, recreation, water supply and flood ntrol is then assessed. The planning background leveloped, plan formulation reviewed and public olvement addressed. Both an early action plan l a framework plan were developed; the former ks to the conservation and development of the in's resources with a 10-year horizon, and the ter looks at long-range requirements and opportities, reaching to the year 2020. Adequacy and ects of the plan as they affect the four major eds of the basin are then addressed. A final apter looks at putting framework plan, investnt analysis and priorities and policy and legisla- e recommendations. (See also W79-03143 and 79-03144) (Zayac-NC)

SQUEHANNA RIVER BASIN STUDY: SUPEMENT A--PLAN FORMULATION.
squehanna River Basin Study Coordinating ommittee.
vailable from the National Technical Information rvice, Springfield, VA 22161 as AD-A043 888, ice codes: A12 in paper copy, A01 in microfiche. ne 1970. 265 p, 28 fig, 22 tab. See also Summary d Supplement B.

escriptors: *Water resources development, iver basin development, *Comprehensive plan- ng, *Watershed management, *Susquehanna ver, Land resources, Land management, Chesa- ake Bay, Administration, Coordination, Multi- e-purpose projects, Economic efficiency, Bene- s, Costs, Investment, Economic impact, Eco- mic justification, Regional analysis, Alternative anning, Long-term planning, Short-term plan- ng, Institutions, Environmental effects, Govern- ents, Recreation, Public participation, Pollution atement, Flood damage reduction, Electric wer, Navigation, Streambank stabilization.

ne objective of this Supplement A to the Main eport is the formulation of a comprehensive plan r the development of water and related land sources of the Susquehanna River Basin. Existing d presently programmed development is inven- ried for a number of items: municipal, industrial d agricultural water supply; general outdoor rec- ation; fish and wildlife; pollution abatement; od damage reduction; streambank stabilization; ectric power; navigation; and the Chesapeake y. An investigation is conducted as to whether a ttern of problems can be determined; the feasibil- of systematic analysis is explored. The plan rmulation work shop approach is outlined, objec- ves are defined and criteria for formulation devel- ed. A formulation procedure is set up, alterna- ve solutions generated, and the alternatives are reened. Base plan measures are selected. The ternatives are studied by objectives; these include conomic efficiency, regional development, envi- nmental quality and multiple-objective formula- on. Critical choices among alternatives are identi- ed as these alternatives apply to four different b-basins--the Upper Susquehanna Basin in New ork, the Chemung River Basin, Condoguinet reek and Codorus Creek--and the Susquehanna iver Basin and Chesapeake Bay. The public influ- nce in the planning process is assessed; local plan- ng meetings and public forums are described. ee also W79-03142) (Zayac-NC)

USQUEHANNA RIVER BASIN STUDY: SUPLEMENT B--PROGRAM SUMMARY.
usquehanna River Basin Study Coordinating ommittee.
vailable from the National Technical Information ervice, Springfield, VA 22161 as AD-A043 889, rice codes: A09 in paper copy, A01 in microfiche. une 1970. 194 p, 48 tab, 47 fig. See also Summary nd Supplement A.

Descriptors: *Programs, *Land management, Watershed management, *Water resources devel- pment, *River basin development, *Susquehanna iver, Chesapeake Bay, Project planning, Long- erm planning, Short-term planning, Comprehen- ve planning, Structures, Land development, Water quality management, Land resources, Non-structural alternatives, Land use, Regulation, Federal government, Water quality, Multiple-purpose reservoirs, Recreation, Fisheries, Water supply, Flood control, Structural measures.

This Supplement B is intended to reinforce the Summary Report by providing more detailed information on the Summary's recommendation. The study was undertaken to provide a comprehensive plan for the development of water and related land resources of the Susquehanna River Basin. In this volume, particular attention is given to the Plan in each of eight hydrologic sub-basins identified in the study, the intent being to make information more accessible at the local and regional level. Each sub-basin is discussed in detail. Its water requirements are inventoried. Short-term recommendations are presented in the form of an Early Action Plan; long-term recommendations are presented in subsequent discussion of rhe Framework Plan. Alternatives to structural measures are then recommended. Following the description of the Plan by sub-basin, a final chapter suggests means to implement it, including general recommendations for the relative share of the costs between Federal and non-Federal interests. Structural and management measures are discussed. Under structural measures, water quality management, major multiple purpose dams and reservoirs, reservoirs for recreation and fishing habitat, groundwater and pipelines for municipal and industrial water supply, local flood protection projects, and upstream watershed projects are reviewed. Under management measures, land and stream management are assessed. (See also W79-03142) (Zayac-NC)

MERAMEC RIVER, MISSOURI, COMPREHENSIVE BASIN STUDY. VOLUME I: MAIN REPORT.
Army Engineer District, St. Louis, MO.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-036 824, Price codes: A13 in paper copy, A01 in microfiche. January 1964. 220 p, 62 tab, 26 fig, 8 plates, attachment.

Descriptors: *Water resources, *Water resources development, *Flood control, *Flow augmentation, *Planning, *Meramec River(MO), Missouri, Water supply development, Multiple-purpose reservoirs, Watershed management, Water quality, Recreation, Fish management, Wildlife management, Economics, Cost-benefit analysis, Coordination, Structural alternatives, Economic justification, River basin development, Plan implementation.

The study's objective is to devise a program for development of the Basin's water and related land resources to meet both short- and long-term needs. The flow of the Meramec River is extremely variable--low flows in the summer are insufficient to provide adequate waste dilution, while flooding at other times is quite destructive. The plan presented for the Basin consists of seven main stem reservoirs, 12 tributary stream reservoirs, 12 headwater reservoirs, 26 angler-use sites and nine local protection projects. The plan will provide: flood control equal to standard project flood protection in the lower basin with upper basin protection against floods of 10- to 15-year frequencies; water quality control and supplemental water supply requirements to the year 2020; practicable recreation and fish and wildlife development; and economic improvement in the upper basin. Hydroelectric possibilities are reviewed and possibilities are retained for further consideration. Recommendations for implementation and coordination are provided; costs are estimated. Detailed considerations of the suggested structural projects are presented. The general outline of the report follows: basin description; present economic development; existing projects and improvements; projected economic growth and related water resource problems; plan formulation; detailed descriptions of the proposed improvements; estimates of first costs and annual charges; estimates of benefits; economic justification; apportionment of costs; coordination with other agencies; local cooperation; and plan implementation. MERAMEC RIVER, MISSOURI, COMPREHENSIVE BASIN STUDY, VOLUME II, APPENDIX A: THE ECONOMY AND CHARACTER OF THE MERAMEC,
Washington Univ., St. Louis, MO.
E. L. Ullman, R. R. Boyce, D. J. Volk, R. C. Smith, and F. Miller.
December 1961, 266 p, 6 chapters.

Descriptors: *Water resources development, *Industries, *Mining, *Recreation, *Land use, *Agriculture, *Population, Missouri, Economic impact, Industrial production, Industrial plants, Mining engineering, Geology, Mineral industry, Environmental effects, Aesthetics, Recreation demand, Recreation facilities, Land management, Land development, Soil conservation, Farms, Crops, Employment, Income, Forestry, *Meramec River(MO), Urban-industrial distribution, Economic development.

The Meramec River Comprehensive Basin Study was undertaken to devise a program for development of the Basin's water and related land resources to meet both short- and long-term needs. Appendix A deals with the economy and character of the study area. No summary is provided as the volume is comprised of six distinct chapters. The first chapter on location, population and development begins with a discussion of terrain, climate and forest cover. Employment and income are reviewed, as is transportation and its relation to the St. Louis metropolitan area. Recent trends in population are outlined as baseline data for projections and predictions. Economic development and education are discussed. Chapter 2 has two parts: physical land conditions and agricultural conditions and trends. In Part 1, a review of land characteristics and capabilities is followed by a review of land use and conservation. Part 2 outlines characteristics of land and farms, trends in acreage of principal crops, crop yields and farms income. Chapter 3 on forestry inventories the Meramec Basin forest resource, reviews factors that affect timber growing, lists timber products and industries and projects the forest future. Chapter 4 is concerned with recreation and scenic resources, summarizing the historical and present recreation in the Basin and projecting future recreational opportunities. Chapter 5 is a report on mining. In Part 1, rock and mineral commodities are outlined, including geology and metallic and non-metallic commodities; Part 2 discusses future possibilities: new mineral developments and prospects for nearby steel production. Chapter 6 deals with towns, industry and trade. Here, the primary areas of emphasis are urban-industrial distribution patterns, industrial competition and the dilemma of industrial promotion. MERAMEC RIVER, MISSOURI, COMPREHENSIVE BASIN REPORT, VOLUME IV. APPENDIX C: HYDROLOGY: APPENDIX D: GEOLOGY, SOILS AND MATERIALS.
Army Engineer District, St. Louis, MO.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-036 827, Price codes: A14 in paper copy, A01 in microfiche. January 1964. 308 p.

Descriptors: Hydrology, *Soils, *Geology, *Construction materials, *Meramec River(MO), Missouri, Hydroloic data, Hydrologic aspects, Hydrologic cycle, Hydrologic systems, Geohydrological units, Synthetic hydrology, Evaporation, Groundwater, Precipitation(Atmospheric), Rainfall, Running waters, Snowfall, Soil water, Runoff, Geologic units, Geologic formations, Engineering geology, Geomorphology, Glaciology, Mineralogy, Physiographic provinces, Materials engineering, Soil types, Soil engineering, Soil groups, Soil properties.

The Meramec River Comprehensive Basin Study was undertaken to devise a program for development of the Basin's water and related land resources to meet short- and long-term needs. This volume is comprised of two appendices. App. C contains hydrologic, hydraulic and water resource data important to the basin-wide plan for the Meramec River. A detailed description of precipitation patterns follows a quick overview of the basin's general climatological features. Annual, seasonal, abnormal, and subnormal precipitation, annual snowfall and rainfall intensity data, are presented. The magnitude and frequency of floods are developed, stream flow data are presented, and yields are estimated. Water supply demands for various uses are noted, and evaluations made as to how these demands can be met by projects considered in the study. Flood control benefit analysis uses hydrologic data developed in this appendix. The purpose of App. D is to present all geologic data that might influence engineering and economic feasibilities of the study's proposed projects. Physiography is reviewed in terms of topography, drainage and geomorphology. General geology of the basin is discussed through an investigation of the geological aspects and mineral resources of the sub-basins, stratigraphic succession, surface rock and groundwater characteristics. The geology of each proposed main stream, tributary and headwater reservoir is outlined. Soil data and the availability of construction materials reviews close out the appendix. W79-03167

MERAMEC RIVER, MISSOURI, COMPREHENSIVE BASIN STUDY, VOLUME V. APPENDIX E: PROJECT DESIGNS AND COST ESTIMATES; APPENDIX F: HYDROPOWER.
Army Engineer District, St. Louis, MO.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-041 696, Price codes: A14 in paper copy, A01 in microfiche. January 1964, 316 p.

Descriptors: *Project feasibility, *Project planning, *Water resources development, *Hydroelectric plants, Missouri, Design, Project purposes, Project life, Sites, Multiple-purpose reservoirs, Economics, Cost allocation, Relocation, Electrical design, Bores, Hydroelectric power, Cost analysis, Planning, Coordination, Pumped storage, Foundation investigations, Economics, *Meramec River(MO), Land requirements, Conventional power, Discharge data, Head data.

The Meramec River comprehensive basin study was undertaken to devise a program for development of the Basin's water and related land resources to meet both short- and long-term needs. Volume V is comprised of two appendices. Appendic E contains the design and cost estimates of the physical features of each proposed element of the recommended comprehensive plan for development of water resources of the Meramec River Basin. A description of each of the seven main stream reservoirs, of the 12 tributary reservoirs, and of the 12 headwater reservoirs is provided. Angler-use sites and local protection projects are described. In each of these descriptions, location, design detail, electrical features, borings, relocations and alterations, land requirements and cost estimates are discussed. Appendix F studies hydropower, its design details, cost estimates, economics and plans. Coordination with the Federal Power Commission and the Southwestern Power Administration is outlined. Conventional power, pumped storage and conventional plant alternatives are weighed. Three facilities are evaluated: Meramec Park, Pine Ford, and Salem. For each, head and discharge data, design details and foundation investigations are presented. Cost estimates follow, and an economic analysis ends the report. (See also W79-03164) (Zayac-NC)
W79-03168

MERAMEC RIVER, MISSOURI, COMPREHENSIVE BASIN STUDY, VOLUME VI. APPENDICES G THROUGH L.
Army Engineer District, St. Louis, MO.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 697, Price codes: A13 in paper copy, A01 in microfiche. January 1964, 296 p.

Descriptors: *Planning, *Water resources development, *Land use, *Reservoirs, *Forest management, *Mineral industry, *Groundwater resources, *Water resources, Missouri, Land resources, Land appraisals, Land classification, Land management, Hydrology, Hydraulics, Hydraulic engineering, Forest soils, Forestry, Watershed management, Mining, Groundwater availability, Groundwater basins, Groundwater movement, Groundwater potential, Groundwater recharge, Water supply, Water quality, *Meramec River(MO), *Mineral resources.

This study was undertaken to devise a program for development of the Meramec Basin's water and related land resources to meet short- and long-term needs. Vol. VI contains 6 appendices. App. G has two parts: Part 1, Physical Land Condition, and Part 2, Design and Cost Esimates for Headwater Reservoirs. Part 1 assesses basin geology and soils, then presents a resource area map. A land use capability classification system is presented, followed by a more extended discussion of land use and conservation measures. Part 2 reviews the geology of the headwater reservoir sites, then outlines hydrologic, hydraulic and engineering investigations of the sites. App. H is a Plan of Participation by the USDA. It outlines departmental planning objectives, the principal features of the USDA study and the scope and responsibilities of USDA agencies. App. I is a Report on Forest Resources Potential. Present and future resources are assessed, as are present and future possibilities of markets for these forestry resources. Impacts and contributions of the resource are reviewed by looking at demands and benefits accruing to the local economy in terms of employment and increased income. App. J--Mineral Resources and Mineral Industry--analyzes the mineral resources of the basin. A section on refractory clays in the basin looks at clay typology and the clay industry. Iron and lead deposits and stone and gravel are reviewed. App. K--Groundwater Use and Production Capabilities--evaulates groundwater use and potential. App. L--a Water Resources Study-- is a preliminary evaluation of the need for and value of storage for municipal and industrial water supply and water quality control in the basin. Projects are described, present water use is outlined, and future water requirements are reviewed. (See also W79-03164)(Zayac-NC)
W79-03169

MERAMEC RIVER, MISSOURI, COMPREHENSIVE BASIN REPORT, VOLUME VII. APPENDICES M THROUGH S.
Army Engineer District, St. Louis, MO.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 698, Price codes: A13 in paper copy, A01 in microfiche. January 1964. 289 p.

Descriptors: *Water resources development, *Multiple-purpose projects, *Recreation, *Fish management, *Wildlife management, *Caves, *Flood control, *Benefits, *Meramec River(MO), Missouri, Recreation demand, Recreation facilities, Reservoir operation, Impoundment, Surface waters, Reservoir storage, Water sources, Water supply, Forest management, Fish populations, Fish conservation, Wildlife conservation, Wildlife, Economics, Flood damage, Flood plains, Flood protection, Floods, Cost-benefits analysis, Estimated benefits, Public opinion, Citizen participation.

This study was undertaken to devise a program for development of the Meramec Basin's water and related land resources to meet short-and long-term needs. This volume contains 7 appendices related to components of the proposed plan. App. M--Recreation Needs Related to Reservoirs--evaluates recreational needs, reviews present status of water-based recreational opportunities and shows that water as a recreation resource is available only in streams or rivers. An attempt is made to analyze recreation demand once reservoirs are in place. App. N--Multiple Use Survey-considers the impacts of the proposed basin project on the Clark National Forest and non-Federal lands. Facilities, services, resources and uses that will be affected are described. App. O--Effect on Fish and Wildlife--reviews present status of fish and wildlife resources, and discusses the effects on these resources once the project is implemented. Benefits and costs resulting from implementation are analyzed and recommendations concerning specific project lands and waters are made. App. P--Effect on Caves--discusses the effects of the proposed reservoir system on the principal caves which are major attractions on the area. No deleterious effect will be suffered other than flooding of the lower level of one cave. App. Q studies Flood Control Economics. Present conditions of flood plain development and flood damages are outlined with and without implementation of the proposed plan. App. R--Evaluation of Benefits--explains the derivation of benefits attributable to the proposed plan. Reservoir benefits for flood control, water quality, water supply, and others are enumerated. Area reorientation benefits are studied; negative benefits are reviewed. App. S--Digest of Public Opinion--reviews public opinion solicited before, during and after the study. W79-03170

MERAMEC RIVER, MISSOURI, COMPREHENSIVE BASIN STUDY, VOLUME VIII. APPENDIX T: DETAILED COST ESTIMATES.
Army Engineer District, St. Louis, MO.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 699, Price codes: A14 in paper copy, A01 in microfiche. January 1964, 327 p, 60 tab.

Descriptors: *Multiple-purpose reservoirs, *Water resources development, *Cost analysis, Missouri, Cost allocation, Economics, Construction costs, Cost-benefit analysis, Cost comparisons, Unit costs, Cost repayment, Benefits, Costs, Low-flow augmentation, Water quality, Water supply, Recreation, Flood control, Conservation. *Meramec River(MO), Economic development.

The Meramec River Comprehensive Basin Study was undertaken to devise a program for development of the Basin's water and related land resources to meet both short- and long-term needs. Appendix T first reviews in a general fashion the bases of design and ways of estimating costs. Basis of design for reservoirs, local protection projects and angler-use sites are summarized from detailed design considerations presented in Appendix E. These design requirements then serve as a basis for very precise cost estimates. Plans for individual reservoirs were considered on a multiple-purpose basis; attention was given to low-flow augmentation, water quality control, water supply, recreation, economic development, conservation and flood control. Costs were allocated on the basis of costs developed in this appendix, and the benefits contained in Appendix R were used to develop benefit-cost ratios for each purpose in each reservoir. The cost estimates for the various elements contained in the comprehensive basin plan are divided into three separate parts: cost estimates for

1 multiple-purpose reservoirs; cost estimates for 9 ocal protection projects; and cost estimates for 26 ngler-use sites. Unit costs are based on July 1963 rice levels and upon experience of comparable vork types in the same area. Allowances are included for contingencies and maintenance during onstruction. (See also W79-03164) (Zayac-NC)

COMMERCIAL SAILING VESSELS - AN ECONOMIC ASSESSMENT,
H. M. Close.
The Naval Architect, No. 5, p 166-168, 1978. 2 tab, 11 ref.

Descriptors: *Ships, *Sailing ships, *Costs, *Energy, *Oil, *Transportation, *Economic feasibility, Economics, Wind energy, Operating cost, Investment, Fuels, Capital costs, Cargo, Weight, Carrying capacity.

Commercial wind-powered sailing vessels would be an uneconomical alternative to conventional oil-powered bulk carriers. While fuel savings are considerable, 10 of the smaller (15,000 metric ton) and three of the larger (50,000 ton) sailing ships would be required to provide the 12.1 trillion ton-miles/year carrying capacity of the conventional 100,000-ton ship, bringing total costs to far more than for the oil-powered vessel (24.7, 12.6 and 8.0 million pounds, respectively). The price of oil would have to double before the 50,000-ton wind powered ship would become economically viable. Most previous comparative studies erroneously based their conclusions of deadweight tonnage, whereas the true measure of cargo capacity is the product of deadweight and the distance the ship can cover in a given period (ton-miles). Capital costs of the three ships are estimated (in million pounds) at eight (smaller sailing ship), 12 (larger sailing ship), and 15.5 (coventional carrier). Wind-powered ships average 10 knots, compared with 15 for the conventional ship. The oil-powered ship requires 130 tons of residual oil/day at sea for fuel, plus one ton/day diesel oil for its auxiliary generating plant. The wind-powered vessels have auxiliary engines which consume 10-21 tons residual oil/day. Potential alternative energy sources include nuclear fission, solar energy, wind-powered generators, and coal. (Lynch-Wisconsin)

EXTRACTION, PRODUCTION AND INVESTMENTS IN CAPITAL AND LEARNING, THE NATURAL RESOURCES INDUSTRIES,
Tel Aviv Univ. (Israel). Foerder Inst. for Economic Research.
G. Fishelson.
Working Paper 34-77 November 1977. 21 p, 1 tab, 3 ref, 4 append.

Descriptors: *Natural resource, *Information, *Technology, *Capital, *Investment, *Resource extraction, Industrial production, Model studies, Mathematical models, Optimization, Economics, Economic efficiency, Public benefits, Welfare(Economics), Cost-benefit analysis, Coal mines, Electricity.

Examination of optimal extraction and investment plans for an exhaustible natural resource such as coal shows that scarce resources might be saved by technological progress induced by direct societal investment in learning. This concept augments earlier studies by (1) Burt and Cummings (1970, who examined optimal behavior of extraction and investment in capital of an industry that extracts natural resources when technological progress is exogeneously determined, and by (2) Rausser (1974), who expanded this model to include learning-by-doing, thus making technological progress an endogeneous variable. The present study assigns a social benefit to the extracted resource only after it is used to produce a consumption good, implying that a learning process carried on simultaneous with production is a substitute for both investment in learning about extraction and in learning-by-doing during extraction. Direct investment in learning supplements learning-by-doing which is a joint product of the extraction activities, and since the total stock of knowledge is thus larger the capital and the exhaustible resource are utilized more efficiently in providing the final good. While Rausser's extension implies that Burt and Cummings extraction rate might be below optimal, the present study suggests that extraction rates might be lower than those by Burt and Cummings. Social benefits in this model are greater than those on the Rausser path, since learning-by-doing is still present while more knowledge is produced by direct investment. (Lynch-Wisconsin)

NOMOGRAPHS FOR TEN-MINUTE UNIT HYDROGRAPHS FOR SMALL URBAN WATERSHEDS,
American Society of Civil Engineers, NY. Urban Water Resources Research Council.
W. H. Espey, Jr, D. G. Altman, and C. B. Graves, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-282 158, Price codes: A03 in paper copy, A01 in microfiche. ASCE Urban Water Resources Research Program Technical Memorandum No. 32. Dec 1977. 22 p, 8 fig, 3 tab, 33 ref. NSF-APR76-17064 and NSF-ENV77-15668.

Descriptors: *Unit hydrographs, *Urban runoff, *Comprehensive planning, *Project planning, *Urban drainage, *Flood protection, Feasibility studies, Hydrologic data, *Metropolitan studies, *Conjunctive planning, Denver, Colorado, Austin, Texas, Master Planning, Combined sewer overflows, Storm sewer discharges.

While characterizations of 30-minute generalized synthetic unit hydrographs have been available for some time, the 10-minute duration relations presented extend the usefulness of this basic tool for analysis of the smaller urban catchments. The synthesized equations and associated nomographs are derived from data for 41 urban watersheds in the U.S. of which 18 are in Texas. Reliability can be enhanced by validation with local field data. A validation example is included for Denver, Colorado. Being Addendum 3 of the report 'Urban Runoff Control Planning,' June, 1977 (NTIS: PB-271 548), new references for the latter are included. This technical memorandum is one of several that will contain additional, individual Addenda over the period 1977-1979. The principal intended audience is agencies and their agents involved in the preparation of areawide plans for water pollution abatement management under Section 208 of PL 92-500, for whom synthesized unit hydrographs are a potential supplementary tool. (ASCE)
W79-03272

URBAN RUNOFF CONTROL PLANNING,
American Society of Civil Engineers, NY. Urban Water Resources Research Council.
M. B. McPherson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 522, Price codes: A09 in paper copy, A01 in microfiche. ASCE Urban Water Resources Research Program, Report NSF/RA-770184, June 1977. 118 p, 263 ref, 2 append. NSF/RANN-APR76-17064.

Descriptors: *Urban runoff, *Comprehensive planning, *Water quality control, *Flood protection, *Feasibility studies, *Urban drainage, *Project planning, Hydrologic data, Computer models, Land use, Local governments, Design storm, Cost analysis, Detention reservoirs, Water balance, Control systems, Sediment control, Water reuse, Forecasting, Monitoring, *Metropolitan studies, *Integrated management, *Gaging network design, *Conjunctive planning, *Master planning, Combined sewer overflows, Storm sewer discharges, Simulation, Urban runoff gaging, Urban rainfall-runoff-water quality relationships, Receiving waters, Stormwater treatment.

Section 208 of PL 92-500 encourages areawide planning for water pollution abatement management, including urban runoff considerations where applicable. Prepare to assist agencies and their agents that are participants in the preparation of areawide plans, from the standpoint of major urban runoff technical issues in long-range planning, emphasized is the importance of conjunctive consideration of urban runoff quantity and quality and the need to develop a factual basis that will support expected reliability of performance of proposed actions and programs. While not intended as a handbook, some important technical issues are analyzed that are often slighted or poorly handled, such as the utilization of simulation. Recognizing that the ultimate test of any plan lies in its implementation, topics are viewed from the perspective and experience of the local government level where implementation takes place. Examples of leading local government projects are included and 310 selected references are cited. (ASCE)

ECONOMICS OF MINED LAND RECLAMATION AND LAND-USE PLANNING IN WESTERN STATES,
Argonne National Lab., IL.
J. R. LaFevers.
In: The Reclamation of Disturbed Arid Lands, ed. by R. A. Wright. University of New Mexico Press, Albuquerque. 1978. p 69-71.

Descriptors: *Mine wastes, *Land use, *Reclamation, *Vegetation regrowth, Administration, Comprehensive planning, Adoption of practices, Legal aspects, Contours, Institutional constraints, Economic feasibility.

The cost effectiveness of mined area reclamation programs involves an integrated analysis of extraction, reclamation, and land-use planning. Reclamation efforts should not only restore but improve land values, where possible, and with the participation of the public sector planners who possess

information on future needs and development criteria. Such participation, however, has not been a practice in the past, due largely to public planners' beliefs that reclamation is unprofitable and the possibility of mandatory participation. Additionally, state laws and Federal reclamation bills have precluded effective planning through short-sighted provisions. Failing to understand that effective integration of reclamation and land use planning is dependent upon the physical, legal, social, and economic characteristics of each area, Federal and state authorities have created provisions for reclaiming mined areas to pre-mining contours and natural vegetation. A number of mine sites in the semiarid southwest, including those in Nevada, southern and northern Arizona, and North Dakota are described in an attempt to illustrate present problems and potential solutions. (Tickes-Arizona)

THE IMPENDING WATER FAMINE,
United Nations Educational, Scientific and Cultural Organization, Moscow (USSR). International Hydrological Programme.
V. I. Korzun, and A. A. Sokolov.
UNESCO Courier, February 1978, p 5-9. 5 fig.

Descriptors: *Surface water availability, *Hydrologic cycle, *Water shortage, Water balance, Social impact, Economic impact, Freshwater, Population, Industrial water, Water quality, Future planning(Projected), Water Resources Planning, Forecasting, Saline water, Desalination.

Although the present volume of water on Earth is 1.386 billion cubic kilometers, the amount, quality, and use of water form a critical social and economic issue that overrides most others of our time. Since most of our water is concentrated as ocean, it is usable for most purposes only after expensive desalinaton processes. The most usable water, .007 percent of the world's total water reserves, is unevenly distributed by way of rivers and lakes. Most of the water which reaches the land is reabsorbed into the atmosphere from the seas and oceans, and precipitated into lakes and rivers. Although the ocean acts as an enormous natural desalting plant, most of this precipitation of fresh water is either returned to the ocean by rivers or added to Arctic and Antarctic glaciers. The real problem, then, is not that the earth is short of water but that its replenishment of freshwater is severely limited. Population growth, development of industry and agriculture, increasing consumption, and the deterioration of quality are documented here as the major factors aggravating this already critical problem. A comprehensive argument is set forth in this analysis to demonstrate that by the year 2015, world water resources will be close to exhaustion in the populated regions of the globe. Only by scientific and worldwide planning can measures be developed and implemented at the national, regional, and global levels to prevent further pollution and dimunition of water supplies. DYNAMIC THEORY OF FISHERIES ECONOMICS--II; DIFFERENTIAL GAME THEORETIC APPROACH,
Illinois Univ. at Urbana-Champaign. Dept. of Economics.
T. Takayama.
College of Commerce and Business Administration, Faculty Working Paper 441, October 1977. 27 p, 1 fig, 11 ref, 1 append.

Descriptors: *Fisheries, *Economics, *Game theory, *Theoretical analysis, *Commercial fishing, Open-loop catch strategy, Closed-loop catch strategy, Cournot-Nash equilibrium, Discount rates, Quadratic functions, Optimization, Welfare(Economics).

Differential game theory is applied to a two-country, one species simulation as a natural extension of the dynamic optimization approach to fisheries economics. Two strategies for solving the Cournot-Nash equilibrium are discussed: (1) the closed-loop catch strategy, and (2) the open-loop catch strategy. Quadratic-benefit is used as the objective function of each county seeking maximization subject to linear population-catch dynamics. Major conclusions: (1) stable optimal catches show that each country must regulate the total catch of its fleet; (2) mesh size should be regulated; (3) the open-loop optimal catch strategy exists only when two countries' future discount rates are the same; and (4) the higher the future discount rates, the more fish will be caught now and in the near future, and the slower the convergence of this fish population to the desired level. In the closed-loop case, and increase of country no. one's future discount rate increases the initial optimal catch of country no. one, while country no. two accepts this fact and curtails its optimal catch accordingly. Of cource, if the sum of the two countries' discount rates exceeds the rate of increase of the fish population, there will be no economically meaningful solution for the closed-loop strategy game. The open-loop strategy may be too restrictive since the condition for the existence of optimal catches depends on the equality of the two discount rates. (Lynch-Wisconsin)

PROCEEDINGS OF A WORKSHOP ON MODELLING OF WATER DEMANDS.
International Inst. for Applied Systems Analysis, Laxenburg (Austria).
Held January 17-21, 1977. Report CP-78-6, June 1978, J. Kindler, Ed. 156 p, 27 fig, 7 tab, 67 ref, append.

Descriptors: *Water demand, *Mathematical models, *Forecasting, Europe, *Water supply, Water utilization, Water resources, Planning, Management, Agriculture, Regional analysis, Economics, Water pollution control, Costs, Linear programming, Equations, Systems analysis.

Water can not longer be considered a free commodity. As nations undertake more and larger projects to meet increasing water demands, the physical limitations of natural water supplies are becoming apparent. Required is an increase in the degree of detail and sophistication of modeling and forecasting water demands, which entails economic, social and environmental evaluation of alternatives aided by the application of mathematical modeling techniques to generate inputs for planning, design, and operational decisions. Presented herein are the proceedings of a Workshop held by the Resources and Environment Area of IIASA in January of 1977, comprising invited papers and reviews that together provide a good overview of what is understood as 'water demand analysis' in most of the IIASA NMO countries. The Workshop was attended by 29 people from 14 countries. Topics considered include: process modeling via linear programming; regional water supply functions; economic demand for water and economic costs of pollution control; and ecological perspective on water demand modeling; and demand modeling in such countries as Germany, Czechoslovakia, the Netherlands, England and Wales; and others. DEMAND, SUPPLY, AND ECONOMIC EFFICIENCY,
Maryland Univ., College Park.
A. C. Fisher.
In: Proceedings of a Workshop on Modelling of Water Demands, 17-21 January 1977, Laxenburg, Austria. J. Kindler, Ed., International Institute for Applied Systems Analysis, CP-78-6, Laxenburg, Austria, June 1978, p 11-17. 1 fig, 2 ref.

Descriptors: *Water resources, *Demand, *Supply, *Economic efficiency, Management, Equations, Marginal costs, Prices, Welfare, Cost curve, Systems analysis.

This brief paper presents an exposition of the concepts of demand, supply, and economic efficiency as a framework for water demand modeling. The information is addressed to engineers and others concerned with modeling and managing water resource systems. Demand is a relationship between price and quantity purchased, and supply is a relationship between quantity produced and incremental cost. In summary, information about the demand for water is important because without it, efficiency in the development and use of a region's water resources is not possible--even with the best technical and engineering information in the world. OCESS MODELLING USING LINEAR PRO-AMMING,
ston Univ., TX.
. Calloway.
Proceedings of a Workshop on Modelling of er Demands, 17-21 January 1977, Laxenburg, tria. J. Kindler, Ed., International Institute for plied Systems Analysis, CP-78-6, Laxenburg, tria, June 1978, 37-45. 4 fig, 2 tab.

criptors: *Resource allocation, Linear pro-nming, *Mathematical models, *Ammonia, ocess modeling, Scarce resources, Demand edules, Production efficiency, Economic effi-cy, Marginal values, Alternative planning, Op-zation, Equations, Systems analysis.

veloped is a mathematical model for an industri-agricultural, or other process which has specific ctural and economic properties. The model ermines the best or optimal subset of production cesses from the complete set of alternatives vided within the model, which is capable of ducing derived demand schedules for scarce ources. Linear programming possesses the nec-ry characteristics to solve the problem of opti-lly allocating limited resources among compet-activities. The model solution: (1) identifies the imal subset of process alternatives (i.e., the pro-ction configuration); (2) the optimum levels of eration for each process selected; (3) the total imal cost of achieving a desired level of produc-n; and (4) the marginal values of limited re-rces. Linear programming models are formulat-in matrix form where the columns of the matrix scribe the processes being modeled. The linear nations are solved si ultaneously for values of activity levels, but since there are usually more riables than equations, many solutions exist. To strate model development, an example ammonia pply problem is considered. (See also W79-083) (Bell-Cornell)

STEMS ANALYSIS APPLIED TO AGRICUL-URAL WATER DEMAND,
ternational Inst. for Applied Systems Analysis, xenburg (Austria).
R. Maidment.
: Proceedings of a Workshop on Modelling of ater Demands, 17-21 January 1977, Laxenburg, ustria. J. Kindler, Ed., IIASA, Laxenburg, Aus-a, June 1978, Publication CP-78-6, p 47-56. 4 fig, ref.

escriptors: *Agricultural, *Water demand, *Sys-ms analysis, Economics, Decision making, Ef-cts, Irrigation, Water supply, Industrial water, inear programming, Mathematical models, Farm vel, Regional level, National level, Systems anal-is.

framework for a systematic approach to the nalysis of agricultural water demand is presented which the factors involved are considered on ree levels: the farm, regional, and national levels. he agricultural production system at each level is egarded as having three components: the inputs, e production process, and the outputs. The math-matical modelling of agricultural water demand is iscussed from the viewpoint of the substitution ossibilities in the production system at each level. is concluded that on a global basis at the present me, agricultural water demand, primarily for irri-ation, is the dominant component of total water ithdrawals and consumptive use. It seems most ppropriate to consider the balance between the upply and demand for agricultural water at the egional level, the demands being modelled at the arm level using linear programming and then ag-regated to find the regional level using demand chedules. Due account must be taken of the differ-nces between agricultural and industrial produc-ion processes, particularly with regard to the spa-ial aspects of agricultural production. DEVELOPING A STATEWIDE WATER INFORMATION SYSTEM FOR MINNESOTA,
Minnesota Univ., Minneapolis. Dept. of Agricultural and Applied Economics.
J. J. Waelti.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 792, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, October 1977. 28 p, 2 fig, 14 tab, 4 ref. OWRT A-031-MINN(4), 14-34-0001-7050.

Descriptors: Planning, *Water rates, *Pricing, *Minnesota, *Surveys, Information exchange, *Sewer water rates, *Information systems.

Results are summarized for a survey on municipal water and sewer rates in Minnesota for 1975. Those utility systems with water meters that have flat charge rate structures for water or sewer should change them to a rate structure which levies charges proportional to water use, preferably a marginal cost pricing system. Those systems using flat charges which have no individual meters should strongly consider installing them since meter installation has been shown to reduce consumption. Declining block rates should not vary the price as much as many rate structures presently do, unless costs can be shown to decline in the same ratio. Minimum demand charges and minimum charges should be dropped in favor of a service charge. (See also W79-03122)
W79-03121

AN ANALYSIS OF RESIDENTIAL WATER DEMAND AND WATER RATES IN MINNESOTA,
Minnesota Univ., Minneapolis. Dept. of Agricultural and Applied Economics.
R. L. Gardner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 687, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Center, University of Minnesota, Bulletin No. 96, Sept. 1977. 63 p, 13 fig, 9 tab, 45 ref, append. OWRT A-031-MINN(5), 14-34-0001-7050.

Descriptors: *Water rates, Pricing, *Minnesota, *Water demand, *Municipal water, *Elasticity of demand, Water policy, Use rates, Sewers, Prices, Water utilization, Water conservation, Water consumption, *Residential water demand.

Price elasticity of demand for residential water in Minnesota is examined, along with policy implications. Common rate forms for pricing municipal water are described and analyzed. Recommendations for improving rate sutrctures in Minnesota are made in relation to theoretical and empirical considerations. (See also W79-03121) (Waelti-Minnesota)

THE COMPARATIVE STUDY OF ENVIRONMENTAL POLITICS: FROM GARBAGE TO GOLD,
Uppsala Univ. (Sweden). Dept. of Political Science.
L. J. Lundqvist.
International Journal of Environmental Studies, Vol. 12, No. 2, 1978, p 89-97. 44 ref.

Descriptors: *Political science, Research priorities, *Review, *Environmental politics, *Interest groups, *Governments, Political aspects, Political constraints, Environmental effects, Environment, Ecology, Social participation, Policy, Administration, Social values, Social aspects.

A literature review of comparative environmental politics and policy stresses the specific responsibility of political science in the process of political change; political scientists should avoid encroaching on the fields of ecology, engineering, or philosophy. Several propositions needing further testing and research are derived from the literature: (1) the more open and conflict-oriented the political system, the more immediate and substantial its reponse to demand for environmental policy, but the less substantial and successful its implementation of policy; (2) the more closed and consensus-oriented the political system, the slower and less substantial its response to demands for policy, but the more substantial and successful its implementation of policy; (3) the more short-term and particularistic the issue pursued by an environmental pressure group, the more democratic the group's internal structure and the more unorthodox and outsider-oriented its strategies of action; (4) the more long-term and general the issue pursued by an environmental pressure group, the more elitist the group's internal structure, and the more orthodox and insider-oriented its strategies for action; and (5) over time, environmental groups tend to perceive their issues and goals in more eternal and general terms, and the groups tend to become more and more elitist in structure and insider-oriented in their strategies. (Lynch-Wisconsin)

THE EXCLUSIVE ECONOMIC ZONE: A CRITIQUE OF CONTEMPORARY LAW OF THE SEA,
Z. A. Kronfol.
Journal of Maritime Law and Commerce, Vol. 9, No. 4, p 461-479, July 1978.

Descriptors: *International waters, *Law of the Sea, *Exclusive economic zone, *United Nations, *Commercial fishing, *Resource extraction, *Jurisdiction, International law, Coasts, Governments, Natural resources, Oceans, UNCLOS III, Shipping, Maximum sustainable yield, Scientific research, Access, Water pollution control, Legal aspects.

A critical assessment of the 200-mi exclusive economic zone (EEZ), being considered by the Third United Nations Conference on the Law of the Sea (UNCLOS III), concludes that such fragmentation of ocean space among more than 100 nations would significantly obstruct vital transnational users of the marine environment. However since adoption of the EEZ is almost certain, the main hope is to retain insofar as possible the rights of the internations community within the zone, focusing on functional rather than territorial sovereignty. Activities or entities adversely affected by EEZ recognition include navigation, commecial fishing, resource extraction, access by land-locked or 'geographically disadvantaged' states, scientific research, conservation, and water pollution control. Under the proposed rules the EEZ would remove

out 36% of the ocean surface from international risdiction and endorse it under national jurisdic-n, rendering meaningless the 1970 General As-nbly Declaration of Principles Governing the a-Bed. Nearly half the ocean area thereby en-osed would be apportioned to high income coun-es--Canada, U.S., Australia, New Zealand, pan, some Eastern European countries, U.S.S.R., d South Africa--while just over half would go to e poorer countries. The EEZ is neither a com-ehensive solution nor an adequate one, and as ch coutries would receive relatively greater bene-s, world economic disparities would widen. ynch-Wisconsin)

EGAL RIGHTS IN POTOMAC WATERS, ROCEEDINGS OF A CONFERENCE AT ARPER'S FERRY, WEST VIRGINIA.
terstate Commission on the Potomac River asin, Bethesda, MD.
eld May 14, 1976, Published September 1976. eport ICPRB General Publication 76-2, 213 p., 2 g, 7 tab, 6 append. Edited by G. Power and R. K. oloszyn.

escriptors: *Potomac river, *Water utilization, Conferences, *River basins, Consumptive use, Di-ersion structures, Federal jurisdiction, Maryland, ennsylvania, Virginia, West Virginia, District of olumbia.

his is a compiltation of papers presented at a nference of the Interstate Commission on the otomac River Basin to air differing perspectives nd define Basin issues. The papers address water upply issues facing the Potomac Basin including: there need for an agency with overall water esource planning and management powers; how hould water be priced in the Washington metro-olitan area; should proposed U.S. Army Corps of Engineers dams and reservoirs be constructed; do he states of West Virginia and Pennsylvania have he power to divert Potomac waters into other asins; under present law, must Virginia and the Corps of Engineers obtain permission from the tate of Maryland before appropriating Potomac vaters; and must specific statues of the various tates be changed in order to achieve an economi-ally efficient allocation of water resouces. Several apers are footnoted, providing references to origi-al source material. Appended material includes: a roposed bill authorizing the construction of a vater diversion structure on the river; proposed mendments to currently applicable law; a state-nent by the federal Environmental Protection Agency, a consumptive use study; and a copy of he Potomac River Law Flow Allocations Agree-nent. THE DEVELOPMENT OF REGIONAL MPACT REVIEW PROCESS AND ITS APPLI-CATION TO GENERAL DEVELOPMENT COR-PORATION'S PORT MALABAR DEVELOP-MENT IN PALM BAY AND BREVARD COUNTY, FLORIDA,
Florida Univ., Gainesville. School of Law.
J. Corbett.
Available from Eastern Water Law Center, Uni-versity of Florida, Gainesville, Florida, 32611, 1978. 35 p, 2 append.

Descriptors: *Environmental effects, Project plan-ning, *Florida, *Land development, Environment, Ecology, Environmental control, Legal aspects, Regulation, Administrtion, Local government, Legislation.

The Development of Regional Impact (DRI) proc-ess is an integral part of the Florida Environmental Land and Water Management Act. A DRI is a development which would have a substantial effect upon the health, welfare, or safety of citizens of more than one county. This article covers: the threshold question of whether a development is one of regional impact; DRI's which are vested and therefore not subject to the DRI review proc-ess; the review process from application to appeal; and the enforcement mechanisms available. The DRI process is illustrated by application to a de-velopment project located in Palm Bay and Bre-vard County. Not only does the DRI process insure an in-depth analysis of long regional impacts of the project, but the process also allows local government to condition approval of the develop-ment. These benefits accrue to Palm Bay and Bre-vard County over and above normal land use controls. Rather than a final solution, the DRI process' effectiveness in addressing regional prob-lems will depend on how well local governments exercise their responsibility. (Rule-Florida)

SIGNIFICANT MANAGEMENT ISSUES IN THE LAW OF THE SEA CONFERENCE: ILLU-SIONS AND REALITIES,
F. Mirvahabi.
San Diego Law Review, Vol. 15, No. 3, p 493-524, 1978.

Descriptors: *Fisheries, *Law of the sea, *United nations, *Conferences, International waters, Trea-ties, Oceans, Conservation, Technology, Explora-tion, International law, Fish management.

Several significant fishery issues are left unsettled by the Third United Nations Law of the Sea Conference. This article discusses these problems and hypothesizes the conseuquences of non-agree-ment of the Conference with respect to fisheries. However, the author believes that the Conference will eventually reach a satisfactory conclusion and resulting treaty. The various maneuvering and ne-gotiating techniques among the different factions of nations participating in the Conference are ana-lyzed. Three major areas are explored. These are the 200-mile exclusive economic zone, conserva-tion regimes and regional fishery problems. Each of these areas is examined through a review of the problem, the Law of the Sea Conference approach, the treaty approach and the non-treaty solution. The various proposals on global conservation of fisheries which have been made by fishery experts fall into two categories. The first establishes global standards while mixing the rights and duties of the individual state with those of regional and global organizations. The second proposal suggests that the Committee on Fisheries manage the problem on a worldwide basis. The author suggests adop-tion of the latter proposal with several suggested additions. (Quarles-Florida)

SUPREME COURT STRIKES NEW BALANCE IN FEDERAL-STATE TENSION OVER WEST-ERN WATER RIGHTS.
Environmental Law Reporter, Vol. 8, No. 9, p. 10182-88, September, 1978.

Descriptors: *Federal-state water rights conflict, *Federal reclamation law, *Arid lands, *Judicial decisions, Surface waters, Appropriation, Prior ap-propriation, Federal government, Environmental control, Forest watersheds, Forest management, Constitutional law.

Two recent decisions of the United States Supreme Court have directly affected the authority of feder-al agencies to acquire, use, or distribute surface waters in the western states. The cases, California v. United States and United States v. New Mexico, are seen by the author as marking a change in direction, if not an about-face, from the previous state of the law in this area. The cases represent a watershed in the history of the federal-state rivalry over the use of western water. California v. United States involves a restrictive reading by the Court of the 1902 Reclamation Act. United States v New Mexico deals with the 1960 Multiple-Use-Sustained Yield Act, a federal act involving national forests. The long-standing conflict between the western states and the federal government over control of water rights is traced in order to provide historical perspective. Both the principal cases and related decisions are analyzed in detail. Through this anal-ysis and by way of comment, the author attempts to set out the environmental implications of these and related decisions. (Hucks-Florida)

RESOURCE DEVELOPMENT AND THE SEABED REGIME OF UNCLOS III: A SUG-GESTION FOR COMPROMISE,
National Security Council, Washington, DC. Inter-agency Task Force on Law of the Sea.
M. A. Conant, and C. G. Conant.
Virginia Journal of International Law, Vol. 18, No. 1, p 61-68, Fall, 1977.

Descriptors: *Law of the sea, *Exploitation, *Ne-gotiation, *United nations, International law, Oceans, Ownership of beds, International waters, Natural resources, Economics, Treaties.

The Third United Nations Conference on the Law of the Sea cannot conclude a comprehensive law of the sea treaty until agreement is reached regard-ing expolitation of seabed resources in the area beyond national jurisdiction. Changing circum-stances have led the 'Group of 77,' a coalition of more than 100 developing countries with common interests within the United Nations system, to change the terms on which resource exploitation may take place within their countries. These na-tions feel they possess unqualified sovereignty over their natural resources. However, United States negotiating principles may be so narrowly defined that these changing circumstances are not appreci-ated. The basic conditions the developed and de-veloping nations have set on the solution of the seabed regime problem may suggest a compromise solution. The U.S. seems to insist upon seabed exploitation terms which other developed coun-tries do not regard as essential. Although U.S. companies view the concept of joint ventures in a unitary system with apprehension, European inter-ests appear willing to accept this arrangement, which may help break the present deadlock in seabed negotiations. (Rule-Florida)
W79-03201

TERRITORIAL STATUS OF DEEPWATER PORTS,
G. L. Dunfee.
San Diego Law Review, Vol. 15, No. 3 p 603-22, 1978.

Descriptors: *Offshore platforms, *International law, *Deep water, *Ships, United States, Coasts, Legislation, Local government, Oceans, Jurisdic-tion, Economics, Oil industry.

The rapid growth of the world's supertanker fleet has created the need for deepwater ports to accom-modate them. The legal status of these offshore ports is not recognized by existing sea convention law. The necessity of granting territorial status to deepwater ports is examined in this article. The first unilateral declaration dealing with deepwater ports, the United States' 1974 Deepwater Port Act, is discussed. The author concludes that the ports are deserving of territorial status, or at least should be allowed an encompassing territorial sea. Suport of territorial status for superports is historical. They are similar in function to both the traditional roadstead and the port. Due to their important coastal purpose, local governments have an inter-est in regulating superport activities. At the very least, deepwater ports should be used to delimit coastlines. Alternatively, a three-mile territorial sea should be recognized around the ports. Future international agreements should be aware of the special problems of these ports. Finally, freedom of the high seas must be balanced against the need for deepwater ports. Because of national security, en-vironmental control and navigational safety, super-ports must have territorial status. (Quarles-Florida)
W79-03202

LEGAL CLAIMS TO NEWLY EMERGED ISLANDS,
J. L. Verner, Jr.
San Diego Law Review, Vol. 15, No. 3, p 525-45, 1978.

Descriptors: *Islands, *International law, *Land forming, *Volcanoes, Pacific Ocean, United States, United Natons, Treaties, Continental shelf, Technology, Exploitation.

As a result of some volcanic activity, it now appears that a new island may be rising out of the Pacific Ocean between the Volcano and the Mariana Islands. This article poses the question of which country the new land would belong to. Four theories of international law are examined. Two predicate claim to a new island on an existing claim to the seabed from which it arose. The 1958 Geneva Convention and the doctrine of occupation are in this class. The doctrines of occupation and discovery assume that a new island would be a territory owned by no one. Occupation consists of exercising control over a territory, while discovery involves finding and then formally annexing territory. The article concludes that only the latter two doctrines could be used in this situation. The undersea geography of the area and the distance from other land would preclude the other doctrines' use. Whether a legal claim to a new island would be pressed by any nation is a matter of conjecture, due to the desired international harmony necessary for settlement of ongoing Law of the Sea Conference negotiations. UNITED STATES INTERESTS IN A CONVENTION ON THE LAW OF THE SEA: THE CASE FOR CONTINUED EFFORTS,
Vanderbilt Univ., Nashville, TN. School of Law.
J. I. Charney.
Vanderbilt Journal of Transnational Law, Vol. 11, No. 1, p 39-75, Winter, 1978. 1 app.

Descriptors: *Conferences, *Negotiations, *Law of the Sea, *United Nations, International waters, Fish management, Navigation, Military aspects, Exploitation, Research and development, Oceans, Adoption of practices.

The ongoing United Nations Conference on the Law of the Sea has covered a broad range of issues involving relations between nations with respect to the Oceans. Issues covered include: (1) fishing; (2) national jurisdictions; (3) navigation; (4) environment; (5) scientific research; (6) seabed exploitation; and (7) transfer of technology. The current product of that negotiation is the Informal Composite Negotiating Text (ICNT) containing 303 treaty articles and seven annexes. United States interests in the Conference include: (1) the impact of these negotiations on multilateral relations; (2) the Conference's precedential effect on other international issues; (3) the future use of the Conference negotiating processes; and (4) the development of a third party dispute settlement system in international relations. The United States' substantive interests in the Conference include: (1) the exploitation of the sea's living resources; (2) protection of the marine environment; (3) the conduct of marine scientific research; (4) military and commercial freedoms of ocean navigation and use; and (5) the exploitation of the non-living deep seabed resources. These interests are analyzed in the context of an existing Convention as well as the non-convention alternative. Tables are included. (Goldberg-Florida)

ELEVENTH HOUR AMENDMENT TO FWPCA RESUSCITATES EPA'S HAZARDOUS SUBSTANCE DISCHARGE PROGRAM,
Environmental Law Reporter, Vol. 8, No. 11, p 10229-31, Nov. 1978.

Descriptors: *Federal water pollution control act, *Administrative agencies, *Regulations, *Water quality standards, Water pollution, Chemical wastes, Federal government, Ecology, Navigable wates, Pollutants, Pollution abatement.

This is a summary of recent Congressional action amending Section 311 of the Federal Water Pollution Control Act. Section 311 prohibits the discharge of oil on designated hazardous substances from vessels and both onshore and offshore facilities into the navigable waters of the United States, onto adjoining shorelines, or into waters of the contiguous zone. The passage of the amendment, which occurred on the next to the last day of the 95th Congress is seen as breathing new life into the federal program for the regulation of hazardous substance spills into the nation's waters. The legislative history of Section 311 is traced in detail. Also discussed are the problems which were faced by the federal Environmental Protection Agency (EPA) when trying to promulgate regulations implementing the provisions of Section 311. A major stumbling block for the EPA was a federal district court decision, Manufacturing Chemists Association v. Costle, which invalidated EPA regulations governing spills and discharges of hazardous chemicals as being inconsistent with the explicit requirements of Section 311. The impact of this case is discussed. (Hucks-Florida)

MINIMUM STREAMFLOWS: THE LEGISLATIVE ALTERNATIVES,
L. P. Hendrix.
Nebraska Law Review, Vol. 57, No. 3, p 704-29, 1978.

Descriptors: *Streamflow, *Irrigation, *Nebraska, *Competing uses, Irrigation effects, River flow, Ecosystems, Regulation, Agriculture, Environmental effects, Intermittent streams, Water utilization.

The concept of 'minimum streamflow,' as applied to Nebraska rivers and streams, is discussed in this article. The term 'minimum streamflow,' as used by the author, means the preservation of instream values - fish, wildlife, recreation, aesthetics, and the environment. The focus of the article is on the dilemma faced by Nebraska legislators when trying to draft streamflow controls. The history of Nebraska as a state dependent on agriculture as an economic resource is traced. Discussed is the role that irrigation plays in supporting and preserving the agriculture industry as are the environmental dangers which result from an uncontrolled use of irrigation. The dangers include intermittent streamflow, dewatering of streams, disruption of ecosystems and the widespread killing of fish and other waterlife. An attempt is made to explore both sides of the issue. The position of environmental groups, such as the Sierra Club and the Audobon Society, who favor maintaining streams in as natural a condition as possible, is contrasted and compared with farmers' interests, which favor legislation maximizing the amount of freshwater available for irrigation. STATE OWNERSHIP OF BEDS OF INLAND WATERS - A SUMMARY AND REEXAMINATION,
Missouri Univ. - Columbia. School of Law.
P. N. Davis.
Nebraska Law Review, Vol. 57, No. 3, p 665-703, 1978, 1 tab.

Descriptors: *Ownership of beds, Streams, *Federal-state water rights conflicts, *Inland waterways, State jurisdiction, Federal jurisdiction, Navigable waters, Grants, Proprietary power, Regulation, Rivers, Lakes.

This article summarizes the basic structure of bed title law, focusing on state ownership of the beds of streams, rivers and lakes. State regulatory and proprietary interests which are furthered by such ownership are explored in depth. These include licensing of bed use, leasing of underlying mineral rights, protection of public use rights, assertion of public trust powers and location of boundaries of abutting privately-owned land. The current law affecting state ownership in states created from federal territories is examined. Through the method of case analysis, the criteria used by federal courts when the extent of state ownership of beds formerly federally-owned is explored. Among these criteria are (1) the 'equal footing' rule; (2) the law of federal and patent interpretation; (3) state rules on incidents to title to abutting uplands; (4) federal and state definitions of navigability; and (5) the law of implied grants of land from the sovereign. The law of bed ownership is traced from its common law roots up through current state and federal statutes. Recent Supreme Court decisions affecting this area are discussed and analyzed. (Hucks-Florida)

THE FATE OF NON-COMPLIANT MUNICIPALITIES WITH REGARD TO THE SECONDARY TREATMENT STANDARDS PURSUANT TO THE 1972 FEDERAL WATER POLLUTANT CONTROL ACT AMENDMENTS - A PROBLEM OF ENFORCEMENT,
T. Bondurant.
University of Richmond Law Review, Vol. 12, No. 3, p 581-91, Spring, 1978.

Descriptors: *Federal water pollution control act, *Municipal wastes, *Adsorption of practies, *Law enforcement, Administrative agencies, Legislation, Waste water(Pollution), Permits, Waste water treatment, Remedies, Water quality standards, Cities.

The evolution of the Federal Water Pollution Control Acts (FWPCA) of 1948, 1956, 1965 and 1972 shows the pre-emption of the federal government in water pollution legislation. Individual states failed to enforce water pollution legislation, probably due to fear of driving industry from the state. Thus the federal Environmental Protection Agency (EPA) became the implementor of the 1972 Act. As of July, 1977, about one-half of all municipalities failed to comply with secondary treatment and water quality standards established by the FWPCA. Attributable to the non-compliance are arguments of a general administrative failure and unrealistic and arbitrary deadlines due to insufficient funding of the construction grant program and technical impractibilities. Non-complying municipalities are subject to civil, criminal, and injunctive sanctions but these are impractical and may be unfair to financially strapped municipalities. Thus, the EPA must develop an ad hoc enforcement scheme to preserve the 1972 Act's integrity, while sparing 'faultless' municipalities. The recommended EPA extra-permit mechanism for these 'good-faith' municipalities is the Enforcement Compliance Schedule Letter (ECSL), which extends the deadlines. Two other extra-permit mechanisms that are used to achieve identical results are the court order schedule and the consent order. (Horwich-Florida)

PUEBLO INDIANS' WATER RIGHTS, NEW MEXICO V. AAMODT, 537 F.2D 1102 (10TH CIR 1976),
W. J. Busch.
Denver Law Journal, Vol. 54, No. 1-2, p 302-12, 1977.

Descriptors: *New Mexico, *Water utilization, *Judicial decisions, *Pueblo water rights, Distribution systems, Appropriation, Reservation doctrine, Competing uses, Priorities, Indian reservations, Treaties, Water resources.

The New Mexico case of New Mexico v. Aamodt was brought to determine the state's water rights. The parties were the United States, New Mexico, private landowners and the Pueblo Indians. The district court held that the Indians' water rights are subject to the New Mexico appropriation system. The circuit court reversed, holding that the Indians' rights are superior to all claims except non-Indians claiming adverse possession prior to 1858, and possibly others not relevant here. But the majority declined to define fully the nature of the Indians' rights, and remanded the case for an analysis of the origin of their water rights. Two issues that need to be resolved are the nature of the Indians' aboriginal rights and the quantification

nd priorities system to be used in water distribu-on. The author argues that an ultimate disposition f the Pueblos' aboriginal rights in the manner of he disposition of Native Alaskan rights should be voided. The justice of trading money for re-ources that cannot be replaced by purchase is uestionable. This is especially true in the Pueblo's outheastern area, where the water supply is inad-quate and the land is worthless without water ights. (Horwich-Florida)

A FEE SIMPLE IN WATER OR A TREND TOWARD FAVORING CITIES. CITY OF GRAND JUNCTION V. KANNAH CREEK WATER USERS ASSOCIATION, 557 P.2D 1173 (COLO. 1976),
E. B. Pickell.
Denver Law Journal, Vol. 55, No. 1, p 153-65, 1978.

Descriptors: *Colorado, *Water rights, *Judicial decisions, *Condemnation, Appropriation, Water supply, Cities, Eminent domain, Water storage, Reservoirs, Reservoir storage, Compensation.

The Colorado case of City of Grand Junction v. Kannah Creek Water Users Association had its origin in 1911, when Grand Junction, in an emi-nent domain proceeding, acquired direct-flow water rights from agricultural appropriators. The judgement awarded the city rights to a continuous flow, but made no express mention of storage rights. In 1973, the city instituted an action to include the right to store water in a reservoir acquired in 1954. Downstream appropriators pro-tested, alleging the city's action would diminish the water quality. The water judge denied storage rights, holding that the city could not divert to the reservoir water not immediately required. The Colorado Supreme Court reversed, distinguishing between water rights acquired by condemnation and by appropriation. It held that the storage right was implied, and was not lost by more than 50 years of non-use, though it would be under appro-priation. The author argues that the court disre-garded existing Colorado water law in allowing the city to acquire a fee simple in water taken by condemnation, and that further compensation was due the farmers. But the decision may be indicative of an emerging policy to ensure that cities have adequate water supplies in times of shortage. (Hor-wich-Florida)

STORING WATER UNDERGROUND: WHAT'S THE AQUI-FER,
Nebraska Univ., Lincoln. School of Law.
N. W. Thorson.
Nebraska Law Review, Vol. 57, No. 3, p 581-632, 1978.

Descriptors: *Underground storage, *groundwater resources, *Aquifer systems, *Arid land, Storage, Arid climates, surface water availability, Temporal distribution, Groundwater recharge, Resource al-location, Planning, Public rights.

The elements of a meaningful system of under-ground water storage rights are examined herein. Ways in which apparent conflicts between the requirements of such a system and presently vested subsurface property rights might be resolved are suggested. Analysis is conducted on three levels. First, the various theories of existing subsurface property rights are examined. These include: (1) the right to store; (2) the right to protect; and (3) the right to recapture. Next, potential conflicts between such existing rights and those elements necessary to a meaningful system of underground water storage rights are identified. Areas of poten-tial conflict include: the allocation of storage rights when storage space is scarce relative to demand; and the resolution of conflicts between ground-storage rights and other property rights. Finally, the author attempts to resolve and avoid potential conflicts by analogizing to the law of surface waters and the law of wild animals. The geograph-ical focus of this article is on the semi-arid western states, where the supplies of usable water are often geographically isolated from the areas of greatest demand. (Hucks-Florida)

WATER AS A LOCATABLE MINERAL: THE HERESY OF THE CHARLESTONE CASE,
E. M. Hill.
North Dakota Law Review, Vol. 54, No. 3, p. 365-74, 1978.

Descriptors: *Water law, *Groundwater, *Water rights, Water resources, Water users, Groundwater mining, Prior appropriation, Mining, Aquifers, Nevada.

In Charlestone Stone Products, Inc. v. Andrus, a federal district court ruled that water may be clas-sified as a 'mineral,' that Congress has manifested no intention of excluding water from the general category of minerals locatable under the 1872 fed-eral Mineral Location Act, and that therefore water is locatable. Affirmed on appeal, the Su-preme Court will review the decision, the sole review issue being whether or not water is a loca-table mineral under the 1872 Act. Unless and until the Charlestone case is overturned, the potential impact on both mining and western groundwater laws is considerable. The decision ignores Con-gressional policy concerning water rights and sets the stage for the destruction of state regulation of water rights in the arid western states. This is so because if water is a mineral locatable under the 1872 Act, a 'miner' is free to install wells on the public domain, and totally deplete the 'mineral deposit' (ground water aquifer) with inpunity against state laws regulating water appropriation and use. The Charlestone decision should be re-versed. (Fortin-Florida)

WATER USE PERMITS IN A RIPARIAN STATE: PROBLEMS AND PROPOSALS,
Kentucky Univ., Lexington. School of Law.
R. C. Ausness.
Kentucky Law Journal, Vol. 66, No. 2, p. 191-265, 1977-78.

Descriptors: *Kentucky, *Water rights, *Water allocation(Policy), *Evaluation, Natural flow doc-trine, Reasonable use, Prescriptive rights, Prior appropriation, Groundwater, Consumptive use, Water resources, Common law.

Although adequate supplies of water are generally available in Kentucky, state law governing its use and allocation are less than satisfactory. Kentucky water law is a complex mixture of common law and statutory water rights. This article attempts to evaluate these rights while suggesting improve-ments. Common law rules, as they relate to surface water and groundwater, are examined. Kentucky's system of statutory water use regulation is ex-plored, with some of the statutory's scheme's more serious deficiencies noted. Short-range legislative changes are recommended, and constitutional issues are accordingly discussed. Long-range alter-natives are briefly considered. The common law rules are said to be uncertain, especially regarding surface water. Under Kentucky's present water regulatory law, significant deficiencies remain. The article sets forth a proposal to serve as a model replacement of the present water allocation law. The proposed law would provide the water regula-tory agency with enough authority to implement a state water resources policy without unnecessary interference to private water users. The proposal also abolishes common law water rights without violating substantive due process of law tenets. (Quarles-Florida)

ERRONEOUSLY MEANDERED LAKESHORE-THE STATUS OF THE LAW AS IT AFFECTS TITLE AND DISTRIBUTION,
J. H. Ohlander.
Marquette Law Review, Vol. 61, No. 3, p. 515-33, Spring 1978.

Descriptors: *Wisconsin, *Meanders, *Lakes, *Boundary disputes, Legal aspects, Recreation, Surveys, Judicial decisions, Land development, Boundaries(Property), Riparian land.

Increased affluence, coupled with interest in out-door recreation, have resulted in an increasing demand for lake and country real estate in Wiscon-sin's northern woodlands. Purchasers may one day find themselves embroiled in disputes over titles to parcels of land which were either mistakenly or fraudulently omitted from the original government surveys. Unfortunately, the applicable law in this area is cryptic and uncertain. However, recent decisions by the Wisconsin Supreme Court have sought to clear up the state of the law. It is clear that when the United States distributes land ac-cording to the official plat which depicts meander lines along the margin of an existing body of water, the actual shoreline defines the extent of the grant. Therefore, the owner of land abutting a lake on the official plat is pressured to hold the water's edge. Wisconsin has a 48-year old statute which provides for the equitable distribution of omitted lands in a manner consistent with federal decisions. Two recent Wisconsin cases, read in conjunction with one another, provide for such distribution without a return to the older cases which are inconsistent with federal law. (Quarles-Florida)
W79-03214

CUSTOM AND LAND-BASED POLLUTION OF THE HIGH SEAS,
J. E. Hickey, Jr.
San Diego Law Review, Vol. 15, No. 3, p 409-75, 1978.

Descriptors: *International law, *Water pollution control, *Oceans, *Pollution abatement, Treaties, Judicial decisions, United Nations, Law of the Sea, Technology, Economics, Political aspects, Interna-tional law.

The introduction of land-based waste to the high seas becomes a problem when it results in the pollution of the marine environment. To qualify as pollution that would be covered by general cus-tomary international law, the result must be real or potential material damage. Only then does the gen-eral principle of international law come into play, that being 'sic utere tuo'--one must so use his own as not to do injury to another. Evidence of the obligation not to pollute the high seas in this manner is found in the protests of states, bilateral and multilateral treaties, judicial decisions, the ac-tivities of the United Nations, declarations of re-gional organizations, a growing body of municipal legislation, and work of the International Law Association. Evidence from these sources is ex-plored. There is a growing tendency to apply a strict standard of liability without regard to fault for the violation of the customary international law obligation not to pollute. However, the interna-tional community has made only an initial foray into the control of land-based pollution. Technol-ogy, politics and economics will play a vital role in this area. (Quarles-Florida)

INTERNATIONAL GROUNDWATER MAN-AGEMENT: THE CASE OF THE U.S. - MEXI-CAN FRONTIERS,
New Mexico Univ., Albuquerque. Coll. of Law.
A. E. Utton.
Nebraska Law Review, Vol. 57, No. 3, p. 633-63, 1978.

Descriptors: *Groundwater resources, *Resources allocation, *Mexico, *United States, International bound and water commission, International Law, Groundwater, Subsurface waters, Aquifer manage-ment, Groundwater availability, Future planning(Projected), Management.

Those states contiguous to Mexico are the United States' heaviest groundwater users, but have inad-equate law and institutions to control this exploita-tion. Additionally, even though the Internatonal Boundary and Water Commission has done a great deal toward resolving groundwater problems. in-

ternational competence over aquifers divided by the border is not defined. The government of Mexico can regulate groundwater extraction through its Secretariat of Water Resources, which can establish prohibited groundwater zones if it is in the public interest. An anticipated increasing investment in groundwater facilities and concurrent demand on the groundwater resources divided by the national border, coupled with the absence of dispute resolution or management institutions increases the potential for Mexican-U.S. dispute over resource control. The economic context and alternative institutional opportunities are examined in this article, while possible management options are investigated. Equitable apportionment, case-by-case negotiation, and comprehensive management are considered, as is international litigation. Whatever options or combinations of options are chosen. It would be better to reach agreement rather than gamble with the uncertainties inherent in litigation before the International Court of Justice. (Rule-Florida)

REGIONAL LAW OF THE SEA: A PROPOSAL FOR THE PACIFIC,
Micronesia Congress. (Trust Territory of the Pacific Islands).
F. L. Ramp.
Virginia Journal of International Law, Vol. 18, No. 1, p. 121-32, Fall 1977.

Descriptors: *International law, *Commercial fishing, *Regional analysis, *Pacific Ocean, Water resources management, Resource allocation, Regional economics, United Nations, Management, Fish management, Law of the Sea, Regional development.

Central and western tropical Pacific states and territories consist mostly of very small islands clustered together into political and cultural groups. Foreign fishing vessels, mostly Japanese, harvest most of the fish taken in the area with little concern for conservation and management. Pacific states are now preparing to take advantage of the 200-mile economic zone giving them resource ownership rights over these fishing areas, thus changing the area's history of free access. Regional law of the sea arrangements in the Pacific would promote shared legal claims and provide efficient use of regional waters, as well as aid individual ends. Common interests and needs in the regions include: effective management of highly migratory species of fish, collection of scientific data, avoidance of wasteful and destructive investment policies, equitable treatment for all states and territories in the region, and enforcement. A major benefit to member states would be the ability to negotiate with distant water fishing states. A large portion of the exclusive economic zone waters of the region belong to territories that are less than fully independent states. The informal Composite Negotiating Text of UNCLOS III should protect their rights. (Rule-Florida)

THE UNITED NATIONS CONFERENCE OF THE SEA (PANEL DISCUSSION AT THE ANNUAL MEETING OF THE AMERICAN BAR ASSOCIATION SECTION OF INTERNATIONAL LAW),
American Bar Association, Chicago, IL.
International Layer, Vol. 12, No. 1, p. 21-62, Winter, 1978.

Descriptors: *Law of the Sea, *International wates, *Conferences, *United Nations, Oceans, Mining, Ownership of beds, International law, Negotiations, Resource allocation, Exploration, Exploitation.

Speakers at the American Bar Association Section of International Law's panel discussion on the United Nations Conference on the Law of the Sea included the head of the Mexican delegation to the Conference, Ambassador Jorge Castaneda. He discussed the exclusive economic zone, under which each coastal state has sorvereign rights to exploit and manage the living and nonliving ocean resources up to a distance of 200 miles from their coasts beyond a territorial sea of 12 miles. Bernard Oxman, deputy head of the United States delegation to the conference, discussed the legal problems inherent in the international law of the sea, and in the interpretation of the Informal Composite Negotiating Text, Myron Nordquist, member of the United States delegation and the State Department's Office of the Legal Advisor, remarked upon changes undergone by the Law of the Sea in the past few years. John Laylin, a member of the State Department's Advisory Committee on the Law of the Sea, discussed deep ocean mining, with emphasis on domestic legislation and possible future courses of action. Finally, the area of development of procedures for compulsory settlement of disputes was covered by Louis B. Sohn, Professor of International Law at Harvard Law School. All presentations and discussion are provided in this article. (Rule-Florida)

REFLECTIONS ON THE FINAL CLAUSES IN THE NEW LAW OF THE SEA TREATY,
S. Rosenne.
Virginia Journal of International Law, Vol. 18, No. 1, p. 133-46, Fall 1977.

Descriptors: *Treaties, *Law of the Sea, *International law, *United Nations, International waters, Legal aspects, Negotiations, Project planning, Conference, Analysis, Oceans.

The text of a treaty's 'final clauses' cannot be settled until the end of the treaty's negotiations. The Informal Composite Negotiating Text issued at the end of the Sixth Session of the Third United Nations Conference on the Law of the Sea included final clauses, primarily noncontroversial and nonsubstantive provisions regarding ratification, accession, entry into force, the status of annexes, the authentic tests, and the testimonium. These clauses are concerned with matters which arise before the entry into force of the treaty. Possible final clauses embodying substantive agreements on the application of the law of treaties or of general international law to this treaty include the question of the relationship of the proposed new convention with other treaties, especially the 1958 Conventions on the Law of the Sea, and the problem of reservations to the new convention. Eventually these clauses--which are traditionally the most controversial--will be drawn into the general negotiations. There are few precedents for the type of problems regarding the final clauses in the proposed convention on the Law of the Sea, thus constructive innovation and the highest degree of legal acumen will be called for. (Rule-Florida)

A NEW COMBINATION TO DAVY JONES' LOCKER: MELEE OVER MARINE MINERALS,
J. K. McCall.
Loyola University of Chicago Law Journal, Vol. 9, No. 4, p. 935-64, Summer, 1978.

Descriptors: *Manganese, *Mining, *Law of the Sea, *Negotiations, International waters, Mineral industry, Oceans, International law, Resources, Exploitation, Conferences, United Nations.

Manganese nodules, mineral conglomerations found on the ocean floors, have recently become the focal point of great interest on the part of industry, financial institutions and governments. The nodules, which have formed over millions of years, contain valuable deposits of nickel, copper, manganese and cobalt. The recent surge of interest in manganese nodules is attributable to increased world need for minerals and the advancement of technology necessary for retrieving the deposits. This increased interest has raised two important questions: (1) who is entitled to mine the nodules; and (2) under what conditions should mining operations be carried out. The complexity of these questions is furthered by the fact that the nodules do not lay within the territorial jurisdiction of any sovereign. Resolution of these questions is necessary for the expansion of this industry. The United Nations Conference on the Law of the Sea ha attempted for four years to negotiate a treaty ou lining the permissible scope of nodule minin Thus far the Conference has been unsuccessfu This article examines the current status of nodul mining and analyzes recent attempts by the Unite Nations and individual countries to institute minin guidelines. IMPLIED RESERVATION CLAIMS AFTE CAPPAERT V. UNITED STATES,
C. S. Murray.
Arizona State Law Journal, Vol. 1977, No. 3, 647-72, 1977.

Descriptors: *Water allocation(Policy), *Reserva tion doctrine, *Federal-state water rights conflict *Desert land act, Water resources, Public lands Regulation, Federal jurisdiction, Water right Proprietary power, Arid lands, Competing use

In the arid western states water has become scarce and valuable natural resource. In respons to this scarcity various doctrines have been deve oped pertaining to rights of ownership and contro over water supplies. One such doctrine is implie reservation. When Congress sets aside land in th public domain for a particular purpose, it impliedl reserves water rights for the benefit of those re served lands--sufficient water to accomplish th intended purpose. The Supreme Court has recentl supported the implied reservation doctrine in Cap paert V. United States. The significance of th Capparet case is examined in detail. A framewor for the analysis of federal claims under the doctrin is offered. Two basic issues likely to arise unde the doctrine are analyzed: first, how the existenc or non-existence of a federally reserved water righ will be determined in a particular situation; an second, once the existence of such a right has bee established, how the reservation will be quantified Economic, social and political ramifications of th doctrine are discussed. (Hucks-Florida)
W79-03221

THE INTERRELATIONSHIP OF GROUND AND SURFACE WATER: AN ENIGMA TO WESTERN WATER LAW,
M. C. Haase.
Southwestern Nevada Law Review, Vol. 10, Spe cial Issue, p. 2069-87, 1978. 3 fig, 1 tab.

Descriptors: *Surface-groundwater relationships *Groundwater resources, *Water management(Applied), *Water conservation Groundwater recharge, Hydrologic budget, Re charge, Hydrology, Hydrologic aspects, Ground water potential, Aquifers, Water requirements.

Ground water as a direct or indirect source o water is not inexhaustible if consumption rate continue their rapid rise. Unplanned exploitation o ground water may affect surface water rights and water tables may be depressed. Allocation of avail able water among claimants could give rise to legal, administrative, and economic problems State and federal authorities must therefore stop dealing with water problems on an ad hoc basis and instead develop water use, allocation and con servation plans through the enactment and en forcement of viable and practical laws. However, before this can be done, the legal and judicial worlds must understand the interrelationship o hydrology to the total environment, especially the direct relationship between surface and ground waters. The most efficient method of providing resource management would appear to be zoning, which also has the benefit of avoiding serious conflicts with fifth amendment prohibitions and requirements. Coordination of the numerous fac tors that must be considered in land/water re source planning could be incorporated in a region al or national zoning agency. (Rule-Florida)

CONGRESS, THE COURT, AND WATER POL LUTION,
Chicago Univ. Law School, IL.

. P. Currie.
he Supreme Court Review, p. 39-63, Univ. of hicago Press, Chicago, Ill., 1977.

escriptors: *Federal water pollution control act, Administrative decisions, *Judicial decisions, Analysis, Water pollution, Legislation, Pollutants, dministrative agencies, Permits, Technology, tandards, Regulation.

he Federal Water Pollution Control Act (Act) rohibits the discharge of any pollutant with sever- specific exceptions provided in the Act. Several itical dates are provided in the Act for the imple- entation of the proper technology required for fluent limitations of point sources. In a recent nited States Supreme Court decision, the Court eld that the federal Environmental Protection gency Administrator may adopt 1977 and 1983 fluent limitations by regulation and that there is o requirement that he provide for variances from ie new-source standards. The first part of the olding, which has been the subject of constant tigation, is of virtually no practical significance. ndustry insists that effluent limitations should be et in the course of issuing individual permits, not y regulation. Lying behind this position is the ractical question whether the appropriate tech- ology required was to be determined on a nation- lly uniform or a plant-by-plant basis. However, his question does not depend upon whether the dministrator may adopt limitations by regulation. ither way, the question of flexibility and variation emains. The article concludes that the case leaves ie question unresolved. (Quarles-Florida)

IARD MINERALS ON THE DEEP OCEAN 'LOOR: IMPLICATIONS FOR AMERICAN .AW AND POLICY,
. F. Pietrowski, Jr.
Villiam and Mary Law Review, Vol. 19, No. 1, p. 3-75, Fall 1977.

Descriptors: *Law of the sea, *Mineral industry, Legislation, *United Nations, Oceans, United States, Legal aspects, International waters, Trea- ies, Negotiations, Jurisdiction, International law.

The Third United Nations Conference on the Law of the Sea recently reconvened for its sixth session. This article reviews the American deep-sea mining policy and maintains that, under existing interna- ional and domestic law, American companies may egally mine the seabed's resources. Moreover, be- cause the United States depends on foreign sources for minerals also, America should undertake unilat- eral action to encourage and protect deep-sea mining companies. Congress must assure American ndustries' access to the minerals of the deep seabed at a reasonable cost. If a treaty resembling the new Informal Composite Negotiating Text be- comes binding, prior ocean mining investments will be rendered worthless. Companies cannot be expected to invest further in deep-sea mining and risk great loss without congressional guarantee of protection. Without this guarantee, the ocean's mineral resources will remain beyond the econom- ic reach of American businesses. With such protec- tion, the United States can become self-sufficient in its needs for manganese, nickel, cobalt and copper. These conclusions are reached after an examina- tion of existing international law, proposed changes, and federal legislative efforts. (Quarles-Florida)

AGRICULTURAL WATER QUALITY ACT.
Hearing, Subcomm. on Conservation and Credit, Committee on Agriculture, U.S. House of Repre- sentatives, Sept. 16, 1977, Serial No. 95-EE, 44p.

Descriptors: *Agriculture, *Water quality stand- ards, *Water conservation, Future planning(Projected), Environmental effects, Con- servation, Negotiations, Farms, Irrigation, Drain- age practices, Water quality control.

This hearing of the Subcommittee on Conservation and Credit of the U.S. House of Representatives' Committee on Agriculture was called to discuss problems in the proposed Agricultural Water Quality Act--House Bill 8150--a bill to provide for the maintenance or enhancement of the quality of water in rural areas. Verbatim statements made before the Subcommittee by the following individ- uals are included: John Adams, director, Environ- mental and Consumer Affairs Division, National Milk Producers Federation; Thomas Barlow, Nat- ural Resources Defense Council; Lyle Bauer, vice president, National Association of Conservation Districts; Albert Erickson, Associate Deputy As- sistant Administrator for Water Planning and Standards, Environmental Protection Agency; James Jeffords, U.S. Rep. from Vermont; Robert Koch, president, National Limestone Institute, Inc.; Richard Swaim, executive director, Obion Forked-Deer Basin Authority; Tennessee; and Edward Thomas, acting administrator, Soil Con- servation Service, U.S. Department of Agriculture. Also included is a letter from Thomas Kimball, representing the National Wildlife Federation, con- taining informal comments on the proposed bill as well as formal Federation resolutions pertaining to its passage. A copy of the proposed bill is pro- vided. (Easterbrook-Florida)

FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1977 (PORTLAND, ME.).
Hearings, Subcomm. on Environmental Pollution, Comm. on Environmental and Public Works, U.S. Senate, June 1, 1977, Serial No. 95-H25, Part 1, 263 p.

Descriptors: *Federal water pollution control act, *Continental shelf, *Federal jurisdiction, *Shore protection, Maine, Oil spills, Fisheries, Environ- mental control, New England, Legislation, Devel- oped waters, Coasts.

The U.S. Senate Subcommittee of Environmental Pollution met to hear testimony on federal water pollution law issues including: the environmental implications of the development of the Outer Con- tinental Shelf; the success of the Maine water pollution control program; progress and problems of the paper industry and its compliance with the Clean Water Act; and alternative treatment tech- nologies for small communities. The issues selected for this hearing were all of particular importance to the people of Maine and other Atlantic Coastal states. The citizens of those states value deeply the unique fishery and recreational resources which they have. One purpose of the hearing was to gather information necessary to assure environ- mental protection of Maine's water resources. The greatest threat to these resources lies with the risk of oil tanker accidents along the coast. Under new rules, the Subcommittee has expanded jurisdiction over ocean pollution problems and issues. The Federal jurisdiction extends to the 200-mile limit. The verbatim text of all statements given before the Subcommittee is included, as well as numerous maps, graphs and technical data tables. (Hucks-Florida)
W79-03226

WATER FOR FIVE CENTRAL ARIZONA INDIAN TRIBES FOR FARMING OPER- ATIONS.
Hearings, Select Committee on Indian Affairs, U.S. Senate, May 23 and 24, 1977, 623 p.

Descriptors: *Arizna, *Indian reservations, *Sur- face water, *Agriculture, Irrigation systems, Sur- face water availability, Administrative agencies, Aquifers, Costs, Legal aspects, Water rights.

Senate Bill 905 provides for the federal acquisition of existing water rights with the state of Arizona to secure a permanent water supply for five central Arizona Indian tribes as a settlement of their legal rights. The Bill also calls for the construction, extension, or rehabilitation of the water delivery systems within each reservation. The 'Winters' case gave the Arizona tribes legal rights to that quantity of surface water necessary to fulfill the purpose for which the reservations were created. These rights were further refined in the later case of Arizona v. California, setting up the standards of 'practicably irrigabel acreage'. This case granted the five tribes the legal rights to sufficient surface water to farm all 'practicably irrigable' lands. It was suggested that a legislative settlement would avoid costly and lengthy litigation. This document contains all verbatim testimony of witnesses relat- ing to the passage of Senate Bill 905. Witnesses include spokesmen for each of the tribes, various federal and Arizona governmental agencies, state and local water resources agencies and U.S. Senate Deconcini, Goldwater and Kennedy. Numerous maps, graphs and tables are also included. (Gold- berg-Florida)
W79-03227

OIL SPILL LIABILITY AND COMPENSA- TION.
Hearings, Committee on Commerce, Science, and Transportation, U.S. Senate, June 9, 10, & 20, 1977, Serial No. 95-27, 346 p.

Descriptors: *Oil spills, *Transportation, *Com- pensation, *Associated costs, Shore protection, Oil pollution, Oil industry, Environmental effects, Economic impact, Damages, Legislation, Adop- tion of practices.

These hearings before the U.S. Senate Committee on Commerce, Science, and Transportation ad- dressed the problems of oil spill liability and com- pensation. The Senate has already passed Senate Bill 682, The Tanker and Vessel Safety Act, which upgrades construction, operation, and manning standards for all vessels entering U.S. waters and ports. But, as long as oil moves on water, there will be oil spills, attendant damage and injured third parties. Despite several major oil spill inci- dents, there has yet to be enacted a law which compensates oil spill victims quickly and without great difficulty. Since oil spill damage is one of the economic costs of transporting and using petro- leum, these bills are intended to internalize those costs and thus show the true cost of petroleum. Senate Bills 121, 687, and 1187 would establish a uniform and comprehensive legal regime govern- ing liability and compensation for damages and cleanup costs. Senate Bill 182 would amend the 1972 Ports and Waterways Safety Act and estab- lish comprehensive liability and compensation for damages from oil spills. Senate Bill 898 is titled 'Spill Prevention and Cleanup for Energy Trans- portation Systems Act of 1977'. All testimony given before the committee, and relevant tables, is included. (Goldberg-Florida)
W79-03228

LAW OF THE SEA CONFERENCE STATUS REPORT, SUMME 1978.
Hearing, Committee on International Relations, U.S. House of Representatives, May 24, 1978, 61 p.

Descriptors: *United Nations, *Law of the Sea, *International law, *Conferences, Continental shelf, International waters, Oceans, Economics, Negotiations, Resources development, Research and development, Ownership of beds.

The U.S. House of Representatives' Committee on International Relations held a hearing to receive a status report on the United Nations' Law of the Sea Conference. The Committee's ultimate goal is to negotiate the substance of a treaty establishing the rule of law for the oceans. The principal speak- er was Elliot Richardson, special representative of the President to the Conference. Richardson's report discussed the achievements of a previous Conference session. In the report, seven issues were identified as hardcore and negotiating groups were established to deal with them. These issues included: (1) exploration and exploitation of the seabed; (2) financial arrangements between seabed mining companies and the proposed U.N. Authori- ty that would be created to oversee this developing area of international law and relations; (3) the institutional framework of the Authority; (4) access of landlocked and geographically disadvantaged states to sea resources; (5) sovereign rights of states within their exclusive economic zne; (6) definition

of outer limits of the continental shelf; and (7) delimitation of maritime boundaries. Attention was also given to the problem of maritime pollution. Richardson's verbatim report to the Committee is included as is the U.S. delegation's unclassified report. (Hucks-Florida)
W79-03229

DEEP SEABED MINERALS: RESOURCES, DIPLOMACY, AND STRATEGIC INTEREST.
Prepared by Congressional Research Service, Library of Congress for the Subcomm. on International Organizations, Comm. on International Relations, U.S. House of Representatives, March, 1978, 123 p.

Descriptors: *Mineral industry, *International waters, *Law of the sea, *Mining, Resources, Legislation, United Nations, Nickel, Copper, Cobalt, Manganese, Technical writing.

A study of deep seabed minerals has been prepared by the Congressional Research Service for the use of the U.S. House of Representatives' Committee on International Relations. The study is intended to clarify a number of issues surrounding domestic and international discussion of deep seabed mining and to assist Congress in considering appropriate legislation. The study summarizes the development of the deep seabed mining issue in the United Nations' Third Law of the Sea Conference, the United States Congress, and the business community. THe study also provides an overview of the use, supply, and demand of nickel, copper, cobalt and manganese. Short and long-term trends in supply are discussed, as well as projections for deep seabed mining. A discussion of the possibilities of cartelization is also included, along with the United States' stockpile strategy. The report includes an analysis of the defensibility of seabed mining operations within the context of a changing ocean regime. The final section contains projections of possible mineral recovery and economic benefits of seabed mining. Some perspective on the possible costs and benefits to the United States are set forth. The need for immedicay of the commencement of deep seabed mining is expressed.(Quarles-Florida)
W79-03230

OILSPILL CONTINGENCY PLAN.
Hearings, Subcommittee of Committee on Government Operations, U.S. House of Representatives, Feb. 2 and 3, 1977. 383, 2 app.

Descriptors: *Environment, *Oilspills, *Transportation, *Comprehensive planning, Environmental effects, Oil pollution, Oil industry, Pollutants, Shore protection, Shore birds, Contingency costs, Legislation.

This Housr of Representatives Subcommittee on Environment, Energy and Natural Resources addressed the problem of oilspills as they relate to damage done to the environment. The hearing focused on the nations ability to respond quickly and effectively to an oilspill emergency. Although the 1972 Federal Water Pollution Control Act addresses this problem in a broad sense, the committee recognized the need for a more comprehensive and coordinated oilspill contingency plan aimed at minimizing the environmental damage caused by oilspills. It is United States' dependence on foreign oil which is exacerbating the problem. Due to the ever increasing volume of oil being transported by ocean-going vessels, the probability of massive oilspills increases proportionately. Testifying before the committee were representatives of those federal agencies having major responsibility under the proposed Oilspill Continengency Plan. Agencies represented included: (1) the Environmental Protection Agency; (2) the Center for Law and Social Policy; (3) the National Oceanic and Atmospheric Administration; and (4) the U.S. Coast Guard. All testimony given before the committee, including maps and tables, is included. (Goldberg-Florida)
W79-03231

INDIAN FISHING RIGHTS.
Hearing, Subcommittee on Fisheries and Wildlife Conservation and the Environment, Committee on Merchant Marine and Fisheries, U.S. House of Rep., Jan. 13, 1978, Serial No. 95-27, 325 p, app.

Descriptors: *Indian reservations, *Fishing, *Resource allocation, *Great Lakes, Fisheries, Federal jurisdiction, Lampreys, Michigan, Regulation, Judicial decisions, Resources, Competing uses.

The House of Representatives Subcommittee on Fisheries and Wildlife Conservation and the Environment met to discuss the extent to which the Federal Government may help resolve conflicts between competing users of Great Lakes fishery resources. Parties to the controversy are Indian-American and non-Indian fishermen. Certain court decisions have ordered a share of fishing waters set aside for exclusive Indian use. Further, the Department of Interior has been ordered by the Supreme Court to act in support of Indians in judicial matters, in its capacity as trust agency over Indian affairs. These federal actions have given rise to strong objections by non-Indians who believe they are being discriminated against in the access to the fishery. The Great Lakes have significant commercial, recreational and esthetic vaues. Traditionally, the states surrounding the Great Lakes have had principal responsibility for managing the fishery resource. However, traditional state regulation has come into doubt as applied to Indian-Americans. The Federal Government takes the position that Indian-American fishermen cannot be regulated in the same manner as other recreational and commercial fishermen. Testimony of witnesses from both sides of the controversy is included. (Hucks-Florida)
W79-03232

ARKANSAS RIVERBED RIGHTS OF CHEROKEE, CHOCTOW, AND CHICKOSAW INDIAN NATIONS.
Hearing Select Committee on Indian Affairs, U.S. Senate, May 25, 1977, 242 p.

Descriptors: *Indian reservation, Federal government, *Riverbeds, *Ownership of beds, *Interstate rivers, Oklahoma, Federal government, Legislation, Property values, Arkansas, Appraisals, Water rights.

This hearing before the U.S. Senate Select Committee on Indian Affairs addressed Senate Bill 660. The proposed bill authorizes the Secretary of the Interior to enter into an agreement with the Cherokee, Choctaw and Chickasaw Indian nations providing for the purchase and/or lease by the United States of each nation's rights and interests in the riverbed of the Arkansas River. Through litigation concluded in the Supreme Court, the three Indian nations have recovered from the state of Oklahoma and other trespassing parties, the fee simple title and possession of the Arkansas River riverbed from the confluence of the Grand-Neosho River in Oklahoma to the western boundary of the State of Arkansas. Appraisals of the riverbed property and property rights have been made and accepted. This bill serves to authorize the Secretary of the Interior to begin formal negotiations. All testimony heard before the committee is included, including statements by spokesman of each Indian nation, by the Acting Deputy Commissioner of Indian Affairs for the Department of the Interior, and U.S. Senators Abourezk, Bartlett and Bellman. A copy of the riverbed property and property rights appraisals is also included. (Goldberg-Florida)

PROTECTION AND ENHANCEMENT OF SOIL AND WATER RESOURCES.
Hearings, Subcomm. on Environment, Soil Conservation and Forestry, Comm. on Agriculture, Nutrition, and Forestry, U.S. Senate, August 2 and 4, 1977, 162 p. app.

Descriptors: *Soil conservation, *Water quality, *Erosion, *Agriculture, Water resources, Legislation, Forestry, Rural areas, Administrative agencies, Sediments, Land use, Comprehensive pla
ning.

Hearings before the U.S. Senate's Subcommitt
on Environment, Soil Conservation, and Forest
were held to discuss two pending bills. The fir
Senate Bill 1280, provides for the maintenance
enhancement of the quality of water in rural are
The second, Senate Bill 1616, establishes a natio
policy concerning agricultural, range, and for
land. Senate Bill 1616 also establishes an agricu
tural land review commission to begin a demo
stration program for protecting agricultural, rang
and forest land from being used for nonagricultu
purposes. These two bills address the serious ne
to conserve soil. Reliable sources indicate that
significant portion of our nation's agricultural
source base is being damaged through erosion a
land-use changes. Copies of both of the propos
bills are provided, along with expert testimo
received by the subcommittee. The Soil Conserv
tion Service Administrator testified as to the enc
mous problems of erosion and sedimentation.
spokesman for the National Farm Growers Asso
ation expressed the Association's complete suppo
of the bills, as did a spokesman for the Natio
Farmers Union. Nearly all of the witnesses e
pressed concern over the rapid rate of disappe
ance of agricultural land. All testimony giv
before the Subcommittee is included. (Quarle

tional waters, *Law of the Sea, Deep water, Mi
eral industry, Minerology, Oceans, Internation
law, International commissions, Ownership
beds, United Nations.

The formulation of a comprehensive law regul
ing the activities of all nations upon the high s
has been continuing since the 1950s. While Unit
Nations; Law of the Sea Conference sessions ha
made progress in resolving differences relating
fisheries, marine pollution and continental she
matters, it was widely felt that an impasse had be
reached in resolving disputes involving the de
seabed. These House of Representatives Hearin
before the Subcommittee on Merchant Marine a
Fisheries addressed House Bills 3350, 4582, 365
4922, 5624, 6846 and 6784. House Bills 3350 a
4582 are bills to promote the ordinary develo
ment of hard mineral resources in the deep seabe
pending the adoption of an international regi
relating thereto House Bills 3652, 4922, 5624, a
6846 are bills to insure the development of Unit
States ocean mining capabilities and support t
continuation of the Law of the Sea Conferen
negotiations. House Bill 6784 is a bill to encoura
an international regime to govern the use of t
oceans and their resources. All testimony giv
before the committee is included. (Goldberg-Flo
ida)

**FEDERAL WATER POLLUTION CONTRO
ACT AMENDMENTS OF 1977 (FORT CO
LINS, COLORADO).**
Hearing, Subcommittee on Environmental Poll
tion, Committee on Environment and Publ
Works, U.S. Senate, June 13, 1977, Serial No. 9
H25, Part 4, 511 p.

Descriptors: *Federal water pollution control a
*Colorado, *Arid land, *Water resources, Env
ronment, Agriculture, Waste treatment, Dredgin
Municipal wastes, Regulation, Water quality, Pla
ning.

This is a report on hearings of the U.S. Senate
Environmental Pollution Subcommittee held
discuss implementation of and possible amen
ments to the Federal Water Pollution Control A
(FWPCA). This hearing focused on three issues

icular concern to Colorado and the rest of the and semiarid West: (1) the relationship of the n water program to agriculture; (2) the prob- of financing municipal waste treatment plants; (3) the implementation of the '404' dredge-and- program. Witness testimony on the first issue usses: the effectiveness of the law in dealing point sources; and what progress if any has made in abating pollution from nonpoint ces not within the FWPCA regulatory pro- n. Testimony on the second issue relates to the ection of charges to cover operating and main- nce costs of municipal waste water treatment ts, and the impact of delays in federal funding tate and local planning activities. Testimony on third issue relates to the controversy over the PCA's section 404 dredge-and-fill program ch ostensibly arose out of misunderstandings of provision and innacurate publicity. All testimo- s included. (Hucks-Florida)

PLEMENTATION OF THE FEDERAL TER POLLUTION CONTROL ACT (REGU- TION AND MONITORING OF TOXIC AND ZARDOUS CHEMICALS).
rings, Subcomm. on Investigation and Review, mmittee on Public Works and Transportation, House of Representatives, July 19, 20, 21, 27, 1977. Serial No. 95-32, 42 p., app.

criptors: *Federal Water Pollution Control , *Sewage treatment, *Ohio River, *Chemical tes, Toxins, Hazards, Chemicals, Monitoring, ulation, Pollutants, Industrial wastes.

ler the auspices of the Federal Water Pollution trol Act (FWPCA), the House Subcommittee investigations and review focused its hearings two water contamination incidents in the Ohio er: spills of carbon tetrachloride; and the dump- of highly toxic hexachorocyclopentadiene EXA) and octachlorocyclopentene (OCTA) in isville, Kentucky sewers. This resulted in the ure of a sewage treatment plant and the direct charge into the river of contaminated raw age. Both incidents temporarily affected down- am communities using the Ohio River as a king water source. The first issue addressed 'Episode Response and Coordination' includ- (1) notification; (2) the state's role; (3) techni- analysis; (4) cleanup assistance; (5) fragmenta- and need for coordination; and (6) environ- ntal law. The second issue was 'Reporting and nitoring' including: (1) monitoring inadequa- ; (2) monitoring needs; and (3) constraints. The d issue was 'Standard Setting and Strategies of ntrol' including: (1) constraints to standard set- ; and (2) strategies for control. The fourth issue 'Alternative Pollution Control Strategies' in- ding: (1) regulation/economic incentives; and health/environmental quality. And the last e discussed was 'Legislative Recommenda- ns'. Included in this document is all testimony rd by the subcommittee. (Goldberg-Florida)

ORSE V. OREGON DIVISION OF STATE NDS (AGENCY OVERSTEPPED ITS AU- ORITY WHEN IT PERMITTED A LAND- LL FOR A NON-WATER-RELATED ACTIVI-).
P. 2d 520-28 (Or. Ct. App. 1978).

scriptors: *Oregon, *Landfills, *Administrative cisions, *Estuarine environment, Administrative ncies, Permits, Common law, Public rights, vigable waters, Conservation, Land develop- nt, Airports.

izen petitioners appealed an order of the defend- , Oregon Division of State Lands (DSL). Co- fendant city had applied for a permit to fill 32 es of the Coos Bay Estuary in order to extend airport runway. The DSL issued the permit on condition the city undertake another project to tigate the resultant loss of estuarial resources. tially, this court-sitting as a review court--vacat- the permit, stating that its issuance was incon- tent with the DSL's administrative rule requir- ing that landfill projects be for a water-related activity. In response, the DSL then enacted a temporary rule deleting the 'water-related activity' requirement of the initial rule, and issued a new fill permit after the defendant city renewed its permit application. Again vacating the permit, the court ruled the DSL's deleting the 'water-related activity' requirement from its original rule was inconsistent with the purpose of the applicable state statute and was outside the agency's power to enact. Aside from the statute, the court also ruled the common-law public-trust doctrine required that public use of the lands underlying navigable waters could not be substantially modified except for water-related purposes. (Horwich-Florida)

COOK V. RUPP (STATUTE GIVES OWNERS OF SWAMP-LAND THE RIGHT TO DRAIN AND PROTECT THEIR LAND FOR AGRICULTURAL PURPOSES).
565 S.W. 2d 833-38 (Mo. Ct. App. 1978).

Descriptors: *Missouri, *Land reclamation, *Levee districts, *Flooding, Adjacent landowners, Impaired water use, Drainage effects, Dredging, Ditches, Swamps, Agricultural watersheds.

Plaintiffs, private landowners, sought an injunction to require defendant adjacent landowner to take remedial action to prevent flooding on plaintiff's land. Plaintiff farmed some of his land, which drained over defendant's marshy land. Defendant began to dredge a lake and deposit the mud onto his land to make it suitable for farming. Plaintiff noticed an unusual amount of water accumulating on his property, and attributed this to the defendant's reclamation work. The trial court granted partial relief, and plaintiff appealed. Affirming the lower court, the appeals court ruled there was insufficient evidence to show the need for or value of the relief sought. Plaintiffs had contended defendant's project was a private reclamation which violated the Halls Levee District's reclamation plan and that because defendant had not sought permission from the district's Board of Supervisors, the reclamation project merited condemnation. But the appeals court reasoned that the statute upon which plaintiff relied includes a provision for private drainage rights. The statute gives the owner of any swamp land the right to drain and protect his property for agricultural purposes--as defendant's were--whether the land be within or without any drainage or levee district. (Horwich-Florida)
W79-03239

ELISSON V. EVANS (WATER RIGHTS ARE SUBSTANTIVE RIGHTS AND CANNOT BE ADJUDICATED IN A SUMMARY MANNER).
583 P.2d 398-402 (Mont. 1978).

Descriptors: *Dams, *Water rights, *Montana, *Adjudication procedure, Surface runoff, Appropriation, Irrigation Flow, Erosion, Ditches, Diversion dams, Adjacent land owners.

Plaintiff-landowners brought action to force removal of a dam on neighbor's property to allow water to resume flowing to their land. Defendant had erected the dam to divert water flowing from the land of a third party. Plaintiffs wished to use the water to irrigate their land. After the District Court ruled against plaintiff and adopted defendant's proposed findings of fact and conclusions of law, the plaintiffs appealed. The Montana Supreme Court held that the trial court should have limited its inquiry to appropriateness of plaintiff's request for a temporary injunction, since its inquiry and subsequent decision went beyond those limits, its findings of fact and conclusions of law had to be vacated. The Court stated that water rights, being a substantive property right, cannot be adjudicated in a summary way. Thus the issue of plaintiff's right to the water flow from defendant's land should not have been decided during the preliminary proceedings for injunctive relief. The Court also noted that the plaintiff's bore the burden of proving a valid appropriation of the water in question. The case was remanded to the trial court for further proceedings. (Hucks-Florida)
W79-03240

STATE OF OREGON V. CORVALLIS SAND AND GRAVEL CO. (CHANGE IN LOCATION OF RIVER BED CAUSED BY FLOOD WAS AVULSIVE AND DID NOT RESULT IN CHANGE OF OWNERSHIP OF BED),
582 P. 2d 135264 (Ore. 1978).

Descriptors: *Ownership of beds, *Avulsion, *Oregon, *Channel flow, Navigable rivers, Beds, Navigable waters, Boundaries, Rivers, Alteration of flow, Legal aspects.

The state of Oregon brought ejectment action against an Oregon corporation to determine ownership of the bed of certain navigable portions of the Willamette River, which was not a interstate boundary. The trial court awarded part of the lands to the State and part to the corporation. On remand, the Supreme Court of Oregon held that the State was entitled to possession of the navigable portions of bed which had been, or might be treated as though they had been, bed of the main channel of the river since statehood. This holding was based on the common law rule that states which were admitted to the union on equal footing with original states, acquired title to beds of their navigable waters, except for portions which had passed into private ownership prior to statehood. The Court further held that where rapidly and violently an overflow channel was changed by flood into bed of river itself, the change in location of the river was avulsive and did not result in a change of ownership of bed; thus the corporate owner of land through which one channel at issue was created, owned the bed of river in that particular channel. (Hucks-Florida)
W79-03241

DEPARTMENT OF TRANSPORTATION V. PSC RESOURCES, INC. (PROPERTY OWNER'S STANDING UNDER ENVIRONMENTAL RIGHTS ACT TO ENFORCE WATER QUALITY IMPROVEMENT ACT UPHELD),
387 A. 2d 393-99, 159 N.J. Super. 154 (Super. Ct. Law Div. 1978).

Descriptors: *New Jersey, *Water quality control, *Waste dumps, *Adjudication procedure, Legislation, State jurisdiction, Water pollution, Penalties(Legal), Damages, Legal aspects, Oil wastes, Adjacent land owners.

Plaintiff property owner brought action against defendant corporation claiming that the corporation discharged petroleum products and other material onto the plaintiff's property pursuant to the operation of a waste oil reprocessing and canning facility. The plaintiff sought judgement for damages and to enforce statutory provisions against the discharge of polluting materials. The defendant counterclaimed that the plaintiff had granted leases or licenses for third parties to dump waste upon plaintiff's property...thereby causing accumulated material to be discharged upon defendant's adjacent property, to its damage. The New Jersey Superior Court held that the plaintiff had standing under the state's Environmental Rights Act to enforce the Water Quality Improvement Act, and that the Superior Court had jurisdiction over the action brought under a state statute providing that no person shall deposit or provide storage facilities for human excrement or other pollutant matter such that it gains access to a body of water. Additionally, the court found that the corporation's failure to comply with provisions of the New Jersey Tort Claims act barred its counterclaim. Motions thus disposed of, a trial would be held. (Rule-Florida)
W79-03242

TOWN OF CHINO VALLEY V. STATE LAND DEPARTMENT (1977 AMENDMENTS TO ARIZONA'S GROUNDWATER CODE FOUND CONSTITUTIONAL).
580 P.2d 704-14 (Ariz. 1978).

Descriptors: *Arizona, *Water distribution(Applied), *Groundwater, *Water transfer, Damages, Groundwater resources, Groundwater availability, Water supply, Reasonable use, Beneficial use, Administrative agencies, Competing uses.

Plaintiff, municipal corporation located in Arizona, brought this special action against the State (Arizona) Land Department (SLD), among others, seeking to prevent enforcement of 1977 amendments to the state's Groundwater Code. The amendments set up a system by which persons--who prior to January 1, 1977 had been transferring groundwater from and within a critical groundwater area for a specific reasonable and beneficial use--could continue such actions if they secured a certificate of exemption from the SLD. If the resulting transfer of water injured another's groundwater supply, damages could be recovered but no injunction would issue. Plaintiffs sought to enjoin the SLD from issuing such a certificate to a defendant city. Plaintiffs contended that: (1) the amendments were unconstitutional in that they violated the separation of powers clause in the state constitution; (2) property was being taken without just compensation; and (3) the state legislature had improperly delegated its powers. The Arizona Supreme Court ruled against the plaintiffs, holding that the amendments' statutory limitation of remedy was within the Legislature's power to enact. Furthermore, compensation for property rights is provided for by awarding past, present and future damages. (Quarles-Florida)
W79-03243

ASSOCIATED ENTERPRISES, INC. V. TOLTEC WATERSHED IMPROVEMENT DISTRICT (EXTENSION OF RESERVOIR CONSTRUCTION PERMIT DID NOT IMPAIR VESTED WATER RIGHTS),
578 P. 2d 1359-67 (Wyo. 1978).

Descriptors: *Wyoming, *Water rights, *Reservoir construction, Reservoir sites, Eminent domain, Watershed management, Administrative agencies, Permits, Landowners, Reservoirs.

Appellants, holders of vested senior water rights, appealed an order affirming the decision of the State(Wyoming) Engineer to grant respondent Toltec Watershed Improvement District a time extension to commence and construct the Toltec Reservoir and associated facilities. Appellants, the owner and lessee of the reservoir site, argued: (1) A permit extension would impair their vested senior water rights; (2) The State Engineer's order was arbitrary and capricious because there was no 'good cause' for an extension; (3) the findings of fact contained in the extension order were not supported by substantial evidence. Affirming the extension, the state supreme court denied the first contention because of the state's power of eminent domain for reservoir construction, and because there was no grant of entry onto the land. The court denied appellants' second contention because the delay in construction was due to litigation concerning the validity of the original permit. The court also found substantial evidence to support the Engineer's findings, and thus affirmed the Order. (Horwich-Florida)

STATE EX REL. DEPT. OF TRANSPORTATION V. TURNIDGE (STATE QUIETS TITLE TO ACCRETED LAND).
579 P.2d 284-86 (Or. Ct. App. 1978).

Descriptors: *Oregon, *Accretion(Legal aspects), *Avulsion, *River flow, Drainage patterns(Geologic), Erosion, Floods, Topographic mapping, Maps, Land forming, Rivers.

Plaintiff state of Oregon brought suit to quiet title to a tract of land bordering the Willamette River. The state's claimed the land was accreted to land owned by its predecessor in interest. Defendants, the owners of property lying directly across the river from the disputed parcel, challenged the state's claim. The primary issue was one of fact, specifically, was the disputed parcel of land created by accretion, as claimed by the state, or by avulsion, as claimed by the defendants. Each party produced expert witnesses who testified as to their opinions relative to the movement of the river during the relevant period of time. The evidence was conflicting and contradictory in many areas. Plaintiff's expert witness relied on two official Army engineers; maps to substantiate the state's accretion claim. Defendant's expert based his opinion primarily on a 1913 topographic map to substantiate the avulsion claim. Concurring with the trial judge, the appeals court ruled that the Army engineers' maps--prepared primarily for navigational purposes--were more reliable than the topographic map, and consequently that the disputed parcel was the result of erosion-accretion as claimed by the state. (Horwich-Florida)

PEOPLE EX REL. KUIPER V. WINDEN (ONE WHO ACCEPTS BENEFITS FROM SALE OF WATER RIGHTS IS ESTOPPED FROM LATER CLAIMING THOSE RIGHTS).
580 P.2d 1238-42 (Colo 1978).

Descriptors: *Colorado, *Water rights, *Appropriation, *Irrigation, Tributaries, Wells, Underground streams, Water works, Water supply, River systems, Competing uses.

Defendants, three shareholders in a ditch digging company, appealed from an injunction enjoining them from irrigating certain lands with well water. The company transported water from the Arkansas River to their property for irrigation uses there. The Pueblo (Colorado) Board of Water Works bought the ditch company's water rights, and the state Water Court subsequently entered a decree permitting use changes requested by the Board and the ditch company. The decree also required that lands historically irrigated by water diverted under the initial water rights were to be permanently removed from irrigation by water drawn from the Arkansas River or its underground tributaries. Plaintiffs, the State Engineer and a division engineer, brought the injunction action when they discovered defendants were still using tributary well water for irrigation. The defendants argued they were not parties to the decree proceeding, and therefore were not restricted by its terms. Ruling against the defendants, the state supreme court adopted the trial court reasoning that even if the decree were avoid as to the defendants, one who accepts and retains the benefits of a void judgement cannot later repudiate his action and take advantage of its invalidity. (Horwich-Florida)

FLOODPLAIN MANAGEMENT AND PROTECTION: PROPOSED POLICIES AND PROCEDURES,
Department of Transportation, Washington, DC.
Federal Register, Vol. 43, No. 121, p. 27148-27150, Thursday, June 22, 1978.

Descriptors: *Flood plains, *Wetlands, *Legal aspects, *Federal government, Water policy, Planning, Regulation, Administration, Standards.

The Department of Transportation presents for public comment its proposed policies and procedures on protection and management of floodplains. The proposal implements both Executive Order 11988, Floodplain Management, and the guidelines for implementing the Executive Order issued by the Water Resources Council on January 25, 1978. (Stihler-Mass).
W79-03253

IMPLEMENTATION OF EXECUTIVE ORDER NOS. 11988 AND 11990, FLOODPLAIN MANAGEMENT AND PROTECTION OF WETLANDS,
Tennessee Valley Authority, Washington, DC.
Federal Register, Vol. 43, No. 107, p. 24228-24229, Friday, June 2, 1978.

Descriptors: *Flood plains, *Wetlands, *Legal a
pects, Water policy, Management, Planning, Regu
lation, Tennessee Valley Authority.

The Tennessee Valley Authority proposes to adop
the presented draft procedures to guide the deve
opment, coordination and review of TVA activ
ties. These procedures are intended to implemen
Executive Order Nos. 11988 and 11990, Floodplai
Management and Protection of Wetlands. (Stihle
Mass)

*Pulp and paper industry, *England, Foreig
countries, Water pollution sources, Legislation
Europe, Effluents, Tidal waters, Coasts, Pipelines
Discharge(Water), Pulp wastes, Persistence, Tox
icity, Absorption.

Implementation of Part II of the Control of Pollu
tion Act (1974) in late 1979 will extend curren
legislative control in the United Kingdom to in
clude nearly all pulp and paper mill discharges
inland and coastal waters. The legislative control
which previously covered only nontidal water
will be extended to cover all discharges throug
pipelines to tidal waters on the sea. A three-par
classificaton scheme has been developed for efflu
ent chemicals according to persistence, toxicity
and bioaccumulation. The United Kingdom gov
ernment remains opposed to attempts by the Euro
pean Economic Community to impose uniform
discharge standards on all similar effluents irre
spective of the geographical location of the di
charger. (Swichtenberg-IPC)

Descriptors: *Environmental impact statements, *Citizen participation, *National Environmental Policy Act, New York State Environmental Quality Review Act, Government decision-making.

Activities of the Cornell Project on Environmental Impact Statements over the period 1975-1978 are described. The purpose of the Project was twofold: to provide assistance to small communities and citizen groups in their review of environmental impact statements; and to develop general guides for the preparation and review of statements, based on the experience gained in these reviews. The organization and administration of the Project, its policies, the specific statements analyzed, the reports and publications produced, and the formal and informal assistance provided to government officials, are described.

Descriptors: *Water resources, *Planning, *Estuarine environment, *Environmental effects, Computer models, Systems analysis, Limnology, Oceanography, Ecosystems, Productivity, Evaluation, San Antonio River Basin(Tex), Guadalupe River Basin(Tex), San Antonio Bay(Tex), *Texas.

This research project was designed to provide a set of analytical tools for water resources planners and decision-makers to assist them in measuring and evaluating the effects of water resources development on estuarine environments. The techniques are designed to be sufficiently flexible to analyze all types of water development and management policies. This report describes: (1) the techniques developed to measure the environmental impact of water resources development on estuarine environments, and (2) the application of these techniques to a prototype Texas river basin - estuarine system to demonstrate the approach of the methodology described and its efficacy. The methodology is tested through application to the Guadalupe and San Antonio River Basins and their associated estuary, San Antonio Bay. The capability and limitations of the methodology and the direction future efforts should take are discussed.

THE IMPACT OF ENVIRONMENTAL LEGISLATION ON ECONOMIC DEVELOPMENT IN APPALACHIAN NEW YORK.
New York State Dept. of Environmental Conservation, Albany. Office of Program Development and Planning.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 698, Price codes: A08 in paper copy, A01 in microfiche. Sponsored by Appalachian Regional Commission, Washington, D.C. NY-3608-74-I-302-0520. Report ARC 74-219 3608, Jan 1977. 167 p, 30 tab, 4 append. 74-219.

Descriptors: *Resources development, *Environmental effects, *Environmental control, *Water quality management, *Air quality management, *Regional economics, *Economic impacts, *Water pollution control, *Impacts, Air pollution, Water pollution, Water pollution sources, Flood plains, Flooding, Waste disposal, Industrial wastes, Appalachian New York, Environmental protection, Waste loadings, Non-point pollution, Economic development, Industrial development, Industry, Legislation.

The purpose of this report is to provide quantitative and qualitative information on the relationship of environmental programs and economic development for Appalachian New York in order to identify points of conflict between environmental management and economic development objectives as well as complementary conditions where objectives are, or can be, mutually supportive. The main focus is on air and water pollution controls as required under the Clean Air Act Amendments of 1970 and the Federal Water Pollution Control Act Amendments of 1972. A smaller assessment was conducted on the National Flood Insurance Program, Coastal Zone Management Program, and national land use legislation. The study area includes Binghampton, Elmira-Corning, Jamestown, Norwich and Olean, NY. Summary findings and recommendations focus on impacts and conditions that deserve attention from policy-makers at Federal, state and local levels, and highlight where environmental programs have been supportive of economic development objectives and where they impinge on development. Recommendations for action, initiatives and procedures are presented. It was found that the major environmental programs assessed will have only marginal impact on economic development in the area. Costs for manufacturers to comply with existing air and water pollution control programs are listed and are not a factor in decisions on the expansion of existing operations or location of new plants. The limited overall growth envisioned for manufacturing industries is due to the unfavorable competitive forces that have affected the industrial base of most of the northeast states. Extensive tables are presented listing costs of compliance, environmental standards, industrial discharges and levels of pollutants, and location of existing industries. (Coan-NC)

OCS OIL AND GAS: AN ASSESSMENT OF THE DEPARTMENT OF THE INTERIOR ENVIRONMENTAL STUDIES PROGRAM,
National Academy of Sciences-National Research Council Washington, DC. Committee on Natural Resources.
Report to the Department of the Interior, Bureau of Land Management, 1977. 119 p, 4 fig, 4 tab, 44 ref, 3 append. AA550-CT6-30.

Descriptors: *Baseline studies, *Environmental effects, *Oil pollution, *Evaluation, Water pollution effects, REsources development, Programs, *Outer Continental Shelf, Energy sources.

The study examined the concepts, procedures, and results of the Department of Interior Environmental Studies Program in order to provide an evaluation and recommendations that the Department could use as a basis for improvement of the Program. The study focused on the needs, concept, and procedures of the Program and the actual or potential use of the results. It is the Committee's finding that the Program has not been based on an adequate assessment and identification of the scientific research that is required to answer environmental concerns for oil and gas operations. urnal of Geophysical Research, Vol 83, No C10, 5011-5018, October 20, 1978. 9 fig, 3 tab, 13 ref, 3 pend. NOAA 03-022-35163, NASA 855-33-05--53.

escriptors: *Ocean waves, *Remote sensing, Radar, *Satellites(Artificial), Measurement, Data ocessing, Statistical methods, Statistics, Oceans, orms, Oceanography, Geos 3, Altimeters, Radar timeters, Wave height.

adar altimeter signals transmitted from the low-biting satellite Geos 3 were analyzed for two lected orbits over high seas associated with hur-cane 'Caroline' in the Gulf of Mexico and a orth Atlantic storm. The measured values of gnificant wave height were in reasonable agree-ent with surface measurements, provided that the timeter data were properly edited. The internal nsistency of estimated wave heights for the orth Atlantic storm, a standard deviation of 0.6 or less, and the good agreement with surface ith lend credence to the method. A statistical alysis of the pulse slope variation gave estimated lues of significant wave height within + or -1 m the true values 75% of the time for spatial eraging over 70 km. (Sims-ISWS)

his report presents the text of the Atmospheric nd Oceanographic Information Processing ystem (AOIPS) Water Resources Data Manage-ent System and its computer-generated displays sed to assist hydrologists when analyzing the hysical processes occurring in watersheds. The OIPS is designed to alleviate some of the prob-ms encountered while investigating the complex terrelationships between: Land cover type; to-ography; precipitation; snow melt; surface runoff; vapotranspiration; and streamflow rates. These roblems result from the varying and dissimilar ata types with which researchers must work. hese dissimilar sources include thematic maps, erial photography, and point-source measure-ents, and they differ in spatial resolution, carto-raphic projection, and dimensionality and format. he report lists various data types needed for ydrologic investigations but which can be accom-odated by this Data Management System. The ata types described are Landsat MSS imagery, igital topographic data, SMS VARR imagery and ore traditional basin maps, streamflow and tem-erature records. Examples of accompanying andsat images and descriptions of these images re provided. The Bear River watershed in North-rn Utah, Idaho and Wyoming was selected as a ase study area to demonstrate and test the system. Coan-NC)

PERFORMANCE EVALUATION OF GUILDLINE MODEL 8400 LABORATORY SALINOMETER,
National Oceanographic Instrumentation Center, Washington, DC.
J. E. Boyd.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 696, Price Codes: A03 in paper copy, A01 in microfiche. Report No. NOAA-TM-NOS-18, July 1976. 23 p, 6 fig, 3 tab.

Descriptors: *Salinometers, *Salinity, *Laboratory equipment, Saline water, Conductivity, Water sampling, Temperature, Sea water.

Results of a laboratory evaluation of the Guildline Model 8400 Laboratory Salinometer (Autosal) is presented. The salinometer is designed to measure the conductivity ratio of sea water samples with an equivalent accuracy of plus or minus 0.003 part per thousand (ppt) salinity and employ a measurement principal entirely different from that of other available instruments. Testing was performed for overall accuracy, repeatability, and stability of the conductivity ratio measurements as well as the effects of variations in bath temperature, ambient temperature, and power supply voltage and frequency. Test results indicate that the instrument's performance exceeds the published specifications of the manufacturer and more specifically that the conductivity ratio accuracy was better than plus or minus part per million equivalent salinity. Results are presented in detail and graphs and other illustrations are included. (Gibson-IPA).

INFLATABLE STRADDLE PACKERS AND ASSOCIATED EQUIPMENT FOR HYDRAULIC FRACTURING AND HYDROLOGIC TESTING,
Geological Survey, Denver, CO. Water Resources Div.
E. Shuter, and R. R. Pemberton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 403, Price codes; A02 in paper copy, A01 in microfiche. Water-Investigations 78-55, July 1978. 16 p, 9 fig, 4 ref.

Descriptors: *Borehole geophysics, *Aquifers, *Hydrogeology, Structural geology, *Aquifer characteristics, Fractures(Geologic), Testing, Methodology, Equipment, Logging(Recording), Planning, Injection wells, Waste disposal wells, Groundwater resources, Transmissivity, *Inflatable packers, *Multiple-aquifer wells.

Independent testing of aquifers is the only way to fully understand the hydrology encountered in boreholes intersecting multiple aquifers. The most feasible method of testing multiple-aquifer wells is through the use of inflatable packers. Straddle packers and associated equipment described are valuable tools for making tests of isolated aquifers as well as conducting hydraulic-fracturing experiments. The system permits multiple tests in a borehole without the necessity of tripping in and out of the hole to redress the packers prior to testing each zone. Electronic pressure transducers, the output of which was fed into strip-chart recorders, were used to monitor the zone being tested, as well as to monitor the zones above and below the packers. This was necessary to ensure that no leaking had occurred around the packers, causing hydraulic continuity between the isolated zones. (Woodard-USGS)
W79-03342

RELATIONSHIP BETWEEN LEAF AREA AND DRY MATTER IN WINTER WHEAT,
Agricultural Research Service, Sidney, MT. Northern Plains Soil and Water Research Center.
J. K. Aase.
Agronomy Journal, Vol. 70, No. 4, p 563-565, July-August, 1978. 3 fig, 14 ref.

Descriptors: *Wheat, Leaves, Plant growth, Growth stages, *Montana, Dry matter.

Models of plant growth and plant water use often require leaf-area measurements, a potentially time-consuming and costly process. The objective of this study was to determine if by establishing a relationship between leaf area and dry matter in winter wheat (Triticum aestivum L. em Thell), that dry matter can be substituted for leaf area. Four cultivars of winter wheat were seeded on Dooley sandy loam and Williams loam (fine-loamy, mixed, Typic Argiborolls) in northeastern Montana in Three divergent growing seasons. Leaf area and dry matter determinations, from random 30-cm row plant samples cut at ground level, were made weekly throughout the season. Leaf area and leaf dry matter were closely correlated (coefficient of determination = 0.951). Leaf area vs. plant dry matter also was closely correlated (coefficient of determination = 0.948) through the fifth growth stage (leaf sheaths strongly erect, tillering complete). Thus it appears that in studies and modeling efforts where leaf area indices are needed, at least for winter wheat, leaf dry matter may be substituted for leaf area index. (Skogerboe-Colorado State)

ILLINOIS NATURAL HISTORY SURVEY REPORTS OF CLAMS AND DUCKS,
Illinois Natural History Survey, Urbana.
R. E. Sparks.
Report No. 164 February 1977 4 p. OWRT B-097-Ill (5).

Descriptors: Water quality, Clams, Benthic fauna, Benthos, Aquatic life, Aquatic populations, Waterfowl, Aquatic animals, *Ducks, *Illinois, Iowa, *Keokuk Pool(Ill-Iowa).

The Keokuk Pool is a 46-mile section of the Mississippi River backed up behind a dam which extends from Hamilton on the Illinois side to Keokuk on the Iowa side. The Pool hosts the greatest concentration of diving ducks in the Mississippi Flyway during Spring and Fall migrations and has been one of the most productive pools of the Upper Mississippi in terms of game and commercial fishes. The heavy abundance of benthic food organisms, particularly fingernail clams. Recent sampling has shown the fingernail clam populations are only 5-10% of the previous year and their size is smaller. Utilization of the Pool by ducks has declined as a result of the lower fingernail clam population. The low clam populations appear to be related to the flow of the Mississippi River, which means that there is less waste dilution. Specific factors responsible for the decline of the clam population have not been identified. Bioassays are being conducted to determine the fingernail clam's water quality requirements.

USERS MANUAL FOR LPTOR - A FORTRAN IV LINEAR PROGRAMMING ROUTINE,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
T. Jonch-Clausen, and J. H. Morel-Seytoux.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 762, Price codes: A03 in paper copy, A01 in microfiche. Interim Report, May 1976. 39 p, 3 append. OWRT B-115-COLO(2), 14-31-0001-5060.

Descriptors: *Linear programming, Water resources, *Computer programs, *Algorithms, FORTRAN language.

A documentation of the computer algorithm LPTOR for solving linear programming problems is presented. The algorithm, known as the general differential algorithm, is briefly described. A detailed input description for the computer program is given, and the use of the program is illustrated by an example. The mathematical flowchart and program listing are appended. A subroutine, GAUSS, which enables the solution of a system of linear equations, as well as the inversion of a matrix, is documented separately in an appendix.

DESCRIPTION OF DATA-COLLECTION SYSTEM AND SYNOPSIS OF SELECTED HYDROLOGIC DATA FOR SOLDIER CREEK BASIN, KANSAS,
Geological Survey, Lawrence, KS. Water Resources Div.
W. J. Carswell, Jr.
Open-file report 78-678, July 1978. 80 p, 32 fig, 5 tab, 8 ref, 2 append.

Descriptors: *Hydrologic data, *Rainfall, *Surface waters, *Groundwater, *Water quality, Sediment transport, Particle size, Streamflow, Peak discharge, Observation wells, Rainfall disposition, Rainfall-runoff relationships, Data collections, *Kansas, *Soldier Creek basin(Kan).

Soldier Creek basin is a long, narrow basin encompassing an area of about 290 square miles almost directly north of Topeka, Kansas. A wide range of hydrologic data has been collected in the basin since the spring of 1964. These data include rainfall, stream discharge, sediment concentrations, chemical quality of water, and ground-water altitudes. The data collection system consists of 7 recording streamflow stations, 5 recording rainfall stations, 51 nonrecording rainfall stations, and 31 ground-water observation wells. Sediment and chemical quality of water samples were collected intermittently at selected sites. A synopsis of the time and space distribution of rainfall and peak flow are provided in graphic and tabular form for selected events of rainfal and peak flow. Representative data concerning the chemical quality of water and the fluvial sediment also are included. Selected ground-water and seepage-investigation data are depicted graphicaly. (Woodard-USGS)
W79-03355

WATER RESOURCES DATA FOR UTAH, WATER YEAR 1977.
Geological Survey, Salt Lake City, UT. Water Resources Div.
Water-Data Report UT-77-1, September 1978. 548 p, 7 fig.

Descriptors: *Utah, *Hydrologic data, *Surface waters, *Groundwate, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water-resources data for the 1977 water year for Utah consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs; and water levels and water quality of ground water. This report contains discharge records for 256 gaging stations; stage and contents for 21 lakes and reservoirs; water quality for 44 hydrologic stations, 161 partial-record stations, and 314 wells; and water levels for 30 observation wells. Additional water data were collected at various sites not involved in the systematic data-collection program and are published as miscellaneous measurements. These data represent that part of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in Utah. (Woodard-USGS)
W79-03356

WATER RESOURCES DATA FOR ARIZONA, WATER YEAR 1977,
Geological Survey, Tucson, AZ. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-287 931, Price codes: A24 in paper copy, A01 in microfiche. Geological Survey Water-Data Report AZ-77-1, September 1978. 550 p, 8 fig.

Descriptors: *Arizona, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water resources data for the 1977 water year for Arizona consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels of observation wells. This report contains discharge records for 235 gaging stations, 79 crest-stage partial-record stations, and discharge measurements at 26 miscellaneous sites; stage records at 2 gaging stations; stage and contents records for 10 lakes and reservoirs; 15 supplementary records, included with gaging-station records, consisting of month-end or monthly stage, contents, and evaporation of lakes and reservoirs, diversions, and return flows; water-quality records for 67 continuous-record stations, 4 partial-record stations, and 12 miscellaneous sites; and water levels for 83 observation wells. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating Federal and State agencies in Arizona. (Woodard-USGS)
W79-03357

WATER RESOURCES DATA FOR INDIANA, WATER YEAR 1977.
Geological Survey, Indianapolis, IN. Water Resources Div.
Water-Data Report IN-77-1, September 1978. 357 p, 4 fig, 22 ref.

Descriptors: *Indiana, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water resources data for the 1977 water year for Indiana consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels in wells. This report contains discharge records for 191 gaging stations, stage and contents for 12 lakes and reservoirs, water quality for 31 gaging stations, and water levels for 50 observation wells. Also included are 124 crest-stage partial-record stations and 50 low-flow partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements and analyses. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Indiana. (Woodard-USGS)
W79-03358

HYDROLOGIC AND GEOMORPHIC DATA FROM THE PICEANCE BASIN, COLORADO, 1972-77,
Geological Survey, Denver, CO. Water Resources Div.

D. G. Frickel.
Open-file data report 78-825, August 1978. 169 p, 5 fig, 22 tab, 2 ref.

Descriptors: *Erosion rates, *Precipitation(Atmospheric), *Runoff, *Sediment yield, *Geomorphology, Channel morphology, Slopes, Sediment transport, Aggradation, Degradation(Stream), Hydrologic data, *Colorado, *Piceance basin(Colo), Oil-shale mining effects.

Erosion measurements made during the period 1972-77 in the Piceance basin of northwestern Colorado are presented in tabular form. Most of the measurements consist of repeated surveys of ground-surface altitudes along monumented transects at 45 hillslope sites and 121 channel sites. The sites were generally resurveyed annualy and after significant hydrologic events. Also included are precipitation, runoff, and sediment-yield data for five small plots with different physical characteristics. The data were collected as part of erosion rate, sediment transport, and channel morphology studies being conducted in conjunction with development of the oil-shale resource of the area. The channel measurements were made to determine rates of aggradation, degradation, and lateral movement. The hillslope measurements were obtained to show rates of soil erosion in the area. WAVE DAMPENING DUE TO RUBBLE-MOUND BREAKWATERS,
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
M. de St. Q. Isaacson.
Journal of the Waterways, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol 104, No WW4, Proceedings Paper 14178, p 391-405, November 1978. 5 fig, 14 ref, 3 append.

Descriptors: *Waves(Water), *Ocean waves, *Breakwaters, *Coastal engineering, Model studies, Mathematical models, Hydraulic models, Harbors, Structures, Coastal structures, Energy dissipation, Hydrodynamics, Engineering, Hydraulics, Wave dampening, Rubblemound breakwaters.

Laboratory experiments were performed to investigate the attenuation of waves propagating along a straight channel bounded by a pair of parallel rubblemound breakwaters. As a reasonable approximation, the spatial gradient of wave height was found to vary with the square of the height. Experimental data of the corresponding attentuation coefficient as a function of relative depth were presented for breakwater slopes of 1/1.5, 1/2, and 1/3. A simplified analysis was presented, and on the basis of this, the experimental results were reduced in order to provide a simple design procedure for the situation under consideration. (Sims-ISWS)
W79-03059

WAVE FORCES ON PIPELINE BURIED IN PERMEABLE SEABED,
New South Wales Univ., Kensington (Australia). Dept. of Theoretical and Applied Mechanics.
H. MacPherson.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol 104, No WW4, Proceedings Paper 14187, p 407-419, November 1978. 4 fig, 9 ref, 3 append.

Descriptors: *Waves(Water), *Pipelines, *Loads(Forces), *Mathematical models, Model studies, Theoretical analysis, Permeability, Seepage, Pore water, Pressure, Flotation, Coastal engineering, Ocean waves, *Underwater pipelines.

The wave-induced seepage force on buried pipelines was evaluated theoretically. The seepage force was shown to be large enough to warrant inclusion in future engineering design calculations for pipeline stability. The pore-water pressure field at a pipeline buried in a permeable seabed was determined from potential theory, and the pressure at the pipe was integrated to give a net seepage force. This force, of constant magnitude, rotates as the waves pass, thereby tending to force the pipe against the surrounding soil in a cyclic manner. As each wave trough passes over the pipeline, the seepage force acts vertically upwards, and when combined with the total bouyant force it increases the likelihood of pipeline flotation. (Sims-ISWS)

LABORATORY EXPERIMENTS WITH SOLITARY WAVE,
Technion - Israel Inst. of Tech., Haifa. Coastal and Marine Engineering Research Inst.
E. Naheer.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol 104, No WW4, Proceedings Paper 14189, p 421-436, November 1978. 14 fig, 1 tab, 21 ref, 1 append.

Descriptors: *Waves(Water), *Laboratory tests, *Mathematical models, Model studies, Theoretical analysis, Ocean waves, Celerity, Roughness(Hydraulic), Velocity, Boundary layers, Oceans, Oceanography, Fluid mechanics, *Solitary waves.

Solitary waves were generated in a wave tank by a piston-type wave generator. The measured surface profile, the wave celerity, and the near-bottom fluid particle velocity under the waves were compared to those given by the approximate solutions of Boussinesq, McCowan, and Laitone. It was found that, although Boussinesq's and McCowan's theories are of lower order of approximation than Laitone's theory, they better present the surface profile and the fluid particle velocity of the wave. The wave celerity, on the other hand, was not presented well by McCowan's theory. It also was found that the differences between the theories increase with increasing wave height to water depth ratio. Calculations of the fluid particle velocity near the bottom showed that the three theories differ significantly when used to describe the fluid particle velocity square. It was recommended to generally use Boussinesq's theory as it represents the overall solitary wave better than the other two. (Sims-ISWS)

DIRECT SOLUTION TO PROBLEMS OF OPEN CHANNEL TRANSITIONS,
Roorkee Univ. (India). Dept. of Civil Engineering.
N. Vittal.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 104, No. HY11, Proceedings Paper 14142, p 1485-1494, November 1978. 6 fig, 1 ref.

Descriptors: *Open channel flow, *Aqueducts, *Channels, Open channels, Hydraulics, Equations, Mathematical studies, Beds, Transition flow, *Transition zones, Open channel transitions, Aqueduct transition.

Existing methods of solving problems of open channel transitions involve trial-and-error solution of higher degree equations, and no direct solutions are available in technical literature. This paper presented unique, dimensionless, discharge-depth relationships for exponential, trapezoidal, and circular channels that facilitate direct solutions to various problems on horizontal, vertical, and combined horizontal-vertical transitions even with change in cross-sectional shape. Use of the proposed relationships was demonstrated with practical examples of culvert and aqueduct transitions. (Lee-ISWS)
W79-03286

BOUYANT SURFACE JET IN TIDAL LONGSHORE CURRENT,
New South Wales Univ., Kensington (Australia). School of Mathematics.
E. J. Wolanski, and M. L. Banner.
Journal of the Hydraulics Division, American society of Civil Engineers, Vol. 104, No. HY11, Proceedings Paper 14186, p. 1505-1519, November 1978. 8 fig, 1 tab, 21 ref.

Descriptors: *Model studies, *Buoyancy, *Currents(Water), Coastal engineering, Hydraulics, Hydraulic jump, Hydrodynamics, Jets, Mixing, Numerical analysis, Outfall sewers, Tides, Water pollution, *Tidal currents, Tidal longshore current.

Calculations were presented showing that a three-dimensional buoyant surface jet discharged supercritically into an infinitely large and quiescent body of receiving water transitions to subcritical flow without the occurrence of an internal hydraulic jump. A numerical model also was used to predict the bulk behavior of the jet created by the discharge of a buoyant effluent into a reversng longshore current. It was found that the plume is stretched in the offshore direction, and that the bulk Richardson number attains a local maximum along the plume center line. It was concluded that the presence of the reversing current generally will not inhibit dilution of the plume. However, under certain circumstances, the model predicted a second transition from subcritical back to supercritical flow; laboratory observations suggested that this corresponds to a splitting of the plume into two parts, one actively growing and the other floating passively in the current and later reentrained into the growing plume. (Lee-ISWS)
W79-03288

ON THE NUMERICAL MODELLING OF SHORT WAVES IN SHALLOW WATER,
International Inst. for Hydraulic and Environmental Engineering, Delft (The Netherlands).
M. B. Abbott, H. M. Petersen, and O. Skovgaard.
Journal of Hydraulic Research, Vol. 16, No. 3, p 173-203, 1978. 14 fig, 57 ref, 1 append.

Descriptors: *Ocean waves, *Water circulation, *Bathymetry, *Model studies, Methodology, Simulation analysis, Hydraulics, Computers, Equations, Boundary processes, Momentum equation, *Short waves, *Boussinesq equation, Breaking waves.

A modelling system was developed to generate and to run models of short waves of periodic or irregular form, with any desired physically realistic current field over any given bathymetry. The system-generated models were based upon Boussinesq equations, in which the vertical velocity is supposed to increase linearly from zero at the bed to a maximum magnitude at the surface, in two independent horizontal space variables and time. The Boussinesq equations were formulated as mass and momentum conservation laws. This formulation appeared to provide genuine weak solutions for correctly simulating breaking waves, and thus assured the correct simulation of wave thrusts, or radiation stresses, and associated longshore currents. (Singh-ISWS)
W79-03292

NEW NONLINEAR SHALLOW-FLOW EQUATIONS WITH CURVATURE,
National Aeronautics and Space Administration, Washington, DC.
R. F. Dressler.
Journal of Hydraulic Research, Vol. 16, No. 3, p 205-221, 1978. 5 fig.

Descriptors: *Unsteady flow, *Nonuniform flow, *Boundary processes, *Channel flow, Analytical techniques, Hydrostatic pressure, Flow separation, Hydraulics, Froude number, Mathematics, Equations, *Saint-Venant equations, Shallow-flow equations, Channel curvature, Streamlines.

New equations were derived which are a generalization of the nonlinear shallow-flow partial differential equations, usually called the Saint-Venant equations. These equations posses terms containing the curvature of channel bottom and the derivative of this curvature. Therefore, the resulting streamlines are curved, and the pressure expression contains additional terms to describe the effect of the streamline curvatures. For flat horizontal channels, the equations reduce to the Saint-Venant equations. The equations showed that the velocity is not constant over any cross section orthogonal to a curved bottom. A curve was presented showing that flow separation, defined in terms of the local Froude number, from a curved bottom will occur as a function of channel curvature. The equation can be solved easily by computer for unsteady flows. (Singh-ISWS)

ENERGY FLUX AND WAVE ACTION IN GRAVITY WAVES PROPAGATING ON A CURRENT,
Technical Univ. of Denmark, Lyngby. Inst. of Hydrodynamics and Hydraulic Engineering.
I. G. Jonsson.
Journal of Hydraulic Research, Vol. 16, No. 3, p 223-234, 1978. 5 fig, 19 ref.

Descriptors: *Waves(Water), *Hydrodynamics, *Energy equation, *Potential flow, Energy, Currents(Water), Momentum equation, Pressure, Velocity, Equations, Dynamic stresses, *Energy flux.

The total energy flux, with the mean energy level as a datum, was shown to be proportional to the wave action flux for waves on steady irrotational currents. This leads directly to the wave action conservation principle. The set-down of the mean water surface was calculated in a new and simple way. In addition, the mean Eulerian current velocity profile was discussed, and the myth of non-zero mass transport in a pure wave motion was reconsidered. Dissipative effects were neglected. (Adams-ISWS)

THE DAMPING OF SOLITARY WAVES,
Coastal and Marine Engineering Research Inst. Haifa (Israel).
E. Naheer.
Journal of Hydraulic Research, Vol. 16, No. 3, p 235-249, 1978. 6 fig, 1 tab, 16 ref.

Descriptors: *Waves(Water), *Boundary layers, *Fluid friction, *Energy dissipation, Fluid mechanics, Reynolds number, Dimensional analysis, Laboratory tests, Analysis, *Boundary roughness, *Wave attenuation, Solitary waves, Wave channels.

The bottom mean resistance coefficient for the flow of solitary waves was derived from considerations of energy dissipation and was obtained from measurements of the attenuation of wave amplitude along a channel. A theoretical expression for the resistance coefficient was developed for the case of laminar flow from the linearized equations of motion and was verified by experiments. Dimensional analysis was used in deriving the empirical relationships which describe the mean resistance coefficient for both laminar and rough turbulent flows. (Adams-ISWS)

POSITIVE FLOW ESTUARY STRUCTURE,
Poseidon Marketing and Development Co., Arcadia, CA. (Assignee).
R. W. Lundh.
U.S. Patent No. 4,114,381, 8 p, 8 fig, 4 ref: Official Gazette of the United States Patent Office, Vol 974, no 3 p 1198, September 19, 1978.

Descriptors: *Patents, *Barriers, *Estuaries, *Tides, Structures, Inflow, Gates, Saline water intrusion, Saline water barriers, Pollutants.

A barrier device comprising a number of gated structures extending between opposite shores of a tidal estuary provides a means of preventing intrusion of heavier, colder sea water with each incoming tide and to then be the means for ejecting large volumes of collected sea water together with mud, sand and sewage pollutants. The eventual effect will be to create a body of fresh water of previously unattainable purity. This purity is renewable with the discharge of any excess water available. During periods of heavy withdrawal from the upstream pool all gates can be locked closed. After danger of flooding has ended the upstream pool can then store a very large volume of fresh water. Flood water is ejected as fast as it flows into the pool. Tidal power can be used to force flood water into the sea. (Sinha - OEIS)

SITE LIMITATIONS ON SOLAR SEA POER PLANTS,
Carnegie-Mellon Univ/, Pittsburgh, PA.
C. Zener.
Journal of Hydronautics, Vol 11, No 1, p 2-3, January 1977. 1 ref.

Descriptors: *Powerplants, *Energy conversion, Resources development, Water resources, *Sites, Outer Continental Shelf, *Ocean Thermal Energy Conversion(OTEC), *Solar energy.

Successful operation of a Solar Sea Power Plant (SSPP) requires that the warm water intake draws water only from the top mixed layer of the ocean. This requirement places an upper limit Qmax, upon the warm water intake. In this paper, Qmax is calculated as a function of thickness of the upper mixed layer, the ocean current velocity, and the site latitude. Typicaly, this paper limit corresponds to a maximum electrical power output of some thousands of megawatts. (Sinha-OEIS)

SYSTEMS ASPECT OF OCEAN THERMAL ENERGY CONVERSION,
TRW Systems and Energy, Redondo Beach, CA.
R. H. Douglass, Jr, and P. J. Bakstad.
Journal of Hydronautics, Vol 12, No 1, p 18-23, January 1978. 9 fig, 5 tab, 6 ref.

Descriptors: *Powerplants, *Energy conversion, *Resources development, Water resources, *Outer Continental Shelf, *Ocean thermal energy conversion(OTEC), *Solar energy.

Solar energy conversion using an ocean-driven heat engine occupies a special place on the systems engineering horizon. In addition to the concept's proven technical feasibility, conditions in the field of OTEC research are such that systems innovations can be readily and profitably implemented. A team led by TRW Systems Group has synthesized a baseline design for an ocean thermal energy conversion (OTEC) plant of 100-MWe output, with initial cost of $2100/KW delivered at the busbar, a cost that could be reduced considerably through the application of new technology and proposed refinements in baseline subsystems. It has been projected that a per-kilowatt cost of $1100 for a functioning OTEC plant could be realized within the next two decades if a vigorous research and development program is carried out. ULTIMATE STRAIN CAPACITY TESTS, CLARENCE CANNON DAM, ST. LOUIS DISTRICT,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Concrete Lab.
J. E. McDonald.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-029 816, Price codes: A04 in paper copy, A01 in microfiche. Miscellaneous Paper C-73-5, March 1973. 53 p, 18 fig, 7 tab, 5 ref, 1 append.

Descriptors: *Concrete testing, *Missouri, *Laboratory tests, *Aggregates, *Strength of materials, Dams, Structures, Hydraulic structures, Concrete, Concrete dams, Petrography, Strength, Stress, Mechanical properties, Testing, Expansion, Thermal expansion, Temperature, Engineering, Civil engineering, *Clarence Cannon Dam(Mo), *Libby Dam(Mo), *Dworshak Dam(Mo), Ultimate strain capacity.

Pertinent physical characteristics, particularly ultimate tensile strain capacity, of 1 simulated interior and 1 exterior concrete mixture containing the coarse aggregate under consideration for use in Clarence Cannon Dam were determined for input to a finite-element computer code for prediction of temperature rise in mass concrete. Results will provide a basis for the establishment of some of the temperature and construction control plans aimed toward minimizing thermal cracking. Generally, the ultimate strain capacity for Clarence Cannon Dam is related more closely to that of Libby Dam, which had a cracking problem, than to that of Dworshak Dam, which had no cracking problem. This is particularly true of the increase in strain capacity, slow versus rapid loading, where the Cannon Dam increase averaged 1.4 times as compared to increases of 1.2 and 2.1 times for Libby and Dworshak Dam, respectively. TEMPERATURE MONITORING OF AN INSULATED WATERMAIN,
Ontario Ministry of the Environment, Toronto. Pollution Control Branch.
M. B. Fielding.
Report No RP 2044, October 1976. 20 p, 6 fig, 2 tab.

Descriptors: *Pipelines, *Monitoring, *Water temperature, *Soil temperature, *Thermal insulation, Insulation, Soil properties, Thermal properties, Water supply, Polystyrene, Frozen soils, Ontario, Canada.

The use of artificial insulation to provide frost protection for shallow-buried watermains in Ontario, Canada is discussed. A test section of pipe, insulated with an overlying slab of expanded polystyrene, was buried at a minimum depth of 3 ft. 6 in. Three temperature monitoring stations, installed in the test section, consisted of six thermistors located in and around the pipe. Two of these stations were automatically recorded; the other was a manual readout. Four other temperature monitoring stations were installed in non-insulated sections of the pipeline. Monitoring, carried out over 16 months, showed soil temperatures, the relationship of the average air temperature, soil temperature adjacent to the pipe and the temperature of the water in the pipe. It was concluded that freezing and below freezing temperatures occur in soil at depths greater than those previously recognized. Although the flat insulation installed for this study produced measurable differences compared to non-insulated sections, it did not provide significant protection of the watermain against freezing. Flat slab insulation designed and installed to preclude freezing temperatures adjacent to a watermain will also retard heat gain in the soil. A reduction of residence time of the pipe contents within the pipe to less than the time to freeze will keep the pipe contents flowing. It is concluded that technology is adequate for the design of watermains to be protected against freezing. (Davison-IPA)

ENVIRONMENTAL IMPLICATIONS IN THE DESIGN OF COOLING WATER INTAKES,
MacLaren (James F.) Ltd., Willowdale (Ontario).
D. B. Hodgins, P. E. Wisner, and F. E. J. Fry.
Canadian Water Resources Journal, Vol 3, No 3, p 33-48, 1978. 6 fig, 10 ref.

Descriptors: *Powerplants, *Cooling water, *Thermal pollution, *Intakes, Heated water, Water temperature, Thermal powerplants, Effluents, Water pollution sources, Thermal stress, Heat resistance, Engineering, Engineering structures, Nuclear powerplants, Design criteria, Intakes structures, Canada, *Thermal effluent.

One of the most important aspects of using surface waters at power plants relates to the withdrawal or intake of cooling water from the aquatic environment. This paper reviews several Canadian case studies involving environmental improvements at intakes, and outlines the stages in a general environmental approach to intake design. (EIS-Deal)

TWO TYPES OF FISH ATTRACTORS COMPARED IN LAKE TOHOPEKALIGA, FLORIDA,
Florida State Game and Fresh Water Fish Commission, Eustis. Eustis Fisheries Research Lab.
R. L. Wilbur.
Transactions of the American Fisheries Society, Vol. 107, No. 5, p 689-695, 1978. 6 tab, 11 ref.

Descriptors: *Fish attractants, *Creel census, *Electro-fishing, *Fish behavior, Fish management, Fish harvest, Florida, Attractants, Lakes, Fish populations, Sampling, Bass, Sunfishes, Catfishes, Sport fishing, *Brush attractor, *Block attractor, *Pipe attractor.

Two types of fish attractors, one made from vitrified clay pipes and the other from cement blocks and brush, were investigated in Lake Tohopekaliga, Florida. Electrofishing, creel census, and experimental fishing were used to evaluate the effectiveness of attractors in concentrating fish and enhancing fishing success. Both attractors produced significantly higher fishing success than did control areas and were generally superior to the average fishing success elsewhere in the lake. Brush-block attractors yielded a slightly higher success rate than the pipe attractors. Fishing success at attractor sites was highest during the first year after installation. The lower fishing success in subsequent years appeared to have been at least partially the result of a lake level drawdown which temporarily reduced the standing crop of fish and stimulated expansion of the littoral zone into deeper areas which had been devoid of plants. Soybean mean was found to be a suplemental fish attractant which increased fishing success at attractor sites where catch rates had diminished. (EIS-Deal)
W79-03469

OXYGEN CONSUMPTION OF COHO SALMON IN A PUMPED SALTWATER RACEWAY,
Weyerhauser Co., Seattle, WA.
G. Ferguson, and B. Allee.
In: 26th Annual Northwest Fish Culture Conference, Dec 3-5, 1975, Otter Rock, Oregon, p 135-140. 2 tab, 7 ref.

Descriptors: *Aquiculture, On-site-investigations, Oxygen, *Oxygen demand, *Oxygen requirements, *Coho salmon, Saltwater, *Fish diets, Fish establishment, Fish farming, Fish hatcheries, Fish physiology, Fish stocking, Oxygen consumption.

Oxygen required for salmon production units must be derived from the air. An experiment was conducted to measure the change in oxygen content as water passes through a pumped saltwater raceway that contained coho salmon. It was observed that oxygen consumption rates are generally higher than those rates presented in the literature. (EIS-Katz)

WATER RESOURCES SEMINAR SERIES NO. 11, (HAWAII), PAPERS PRESENTED JANUARY 1978 TO JUNE 1978.
Hawaii Univ., Honolulu. Water Resources Research Center.
June 1978. 25 p.

Descriptors: *Organic compounds, *Water reuse, *Gas chromatography, Soil removal, *Flood insurance, Flood control, Manning's equation, Flash floods, Streamflow, Synoptic analysis, *Hawaii, XAD-2 resin, *Mass spectrometry, Lahaina soil, Mililani Sewage Treatment Plant, *Flood Insurance Act, Log Pearson Type III, Bernoulli's theory, Synchronous Meteorological Satellite imagery, Telemetered rain gages.

The Spring 1978 Seminar Series include three papers that present material on (1) the identification of organic compounds in treated effluent for irrigation and the determination of whether such compounds are removed from percolating water by the soil (Green, pp. 1-4); (2) the National Flood Insurance Program, the methods and procedures used to prepare the 100-year flood insurance inundation maps of Hawaii, and the status of the flood maps (Jay, pp. 5-11); and (3) the factors contributing to Hawaiian flash floods, e.g., topography, steep watersheds with narrow basins and low capacities, sufficiently varied synoptic patterns that can cause floods in any month, stream response, and a detection system that depends primarily upon telemetered rain gages and which has no National Weather Service weather radar in Hawaii (Schroeder, pp. 13-25).

WATER RESOURCES SEMINAR SERIES NO. 10 (HAWAII), PAPERS PRESENTED SEPTEMBER 1977 TO DECEMBER 1977.
Hawaii Univ., Honolulu. Water Resources Research Center.
December 1977. 30 p.

Descriptors: Dams, Cofferdams, Water supply, *Rhyolite aggregate, Wind waves, Lake shore erosion, Wind speed, *Riprap particles, Solar radiation, Radiation measurement, *Network sensors, *Hawaii, Aquatic algae, Oysters, Commercial shellfish, Water pollution, Dolosse, High Island, Hong Kong, Carlyle Lake, Rayleigh distribution, Eppley pyranometers, Eppley radiometer, Aquaculture, Biosynthesis, Kaneohe Bay, Kahuku, Ultraviolet filtration.

The Fall 1977 Seminar Series No. 10 includes four papers that cover a range of topics from dams constructed in the sea to exploit the last remaining major catchment in the Kai Kung Peninsula and to provide a freshwater reservoir to serve the Hong Kong area (Watson, pp. 1-8); to a practical design criterion proposed to stabilize lake shores against wind waves and the development of a methodology for estimating the height of wind waves in any lake for a given wind condition (Bhowmik, pp. 9-12); to the augmentation of a network of sunlight observations, begun in the 1930s, with the installation of Eppley pyranometers at 14 new sites on Oahu in 1976 as well as the measurement of diffuse and global radiation at the University of Hawaii Manoa campus, the primary observation site (Ekern, pp. 13-21); and to the establishment, maintenance, and development of a shellfish aquacultural system in Hawaii (Wiebanga, pp. 23-30).

AQUIFER MANAGEMENT
Summary Appraisals of the Nation's Ground Water Resource--Mid-Atlantic Region,
W79-03344 4I

AQUIFER SYSTEMS
Storing Water Underground: What's the Aqui Fer,
W79-03211 6E

AQUIFERS
Identification of Hydrodispersive Mass-Transfe Parameters in Aquifers by Interpretation o Tracer Experiments in Radial Converging o Diverging Flow (Identification des Parametre Transport Hydrodispersif Dans Les Aquifere par Interpretation de Tracages en Ecoulemen Cylindrique Convergent ou Divergent),
W79-03279 2F

Inflatable Straddle Packers and Associate Equipment for Hydraulic Fracturing and Hydrologic Testing,
W79-03342 7E

RCTIC
Distribution and Abundance of Phytoplankton in 153 Lakes, Rivers, and Pools in the Northwest Territories,
W79-03185 5C

RID CLIMATES
Hydrologic Reconnaissance of theFish Springs Flat Area, Tooele, Juab, and Millard Counties, Utah,
W79-03350 4A

RID LAND
Storing Water Underground: What's the Aqui-Fer,
W79-03211 6E

Federal Water Pollution Control Act Amendments of 1977 (Fort Collins, Colorado).
W79-03236 6E

RID LANDS
Supreme Court Strikes New Balance in Federal-State Tension Over Western Water Rights.
W79-03200 6E

RIZNA
Water for Five Central Arizona Indian Tribes for Farming Operations.
W79-03227 6E

RIZONA
Gravity Analysis of the Subsurface Structure of the Upper Santa Cruz Valley, Santa Cruz County, Arizona,
W79-03002 2F

Alternatives for Managing a Finite Groundwater Supply in an Arid Region,
W79-03131 4B

Town of Chino Valley V. State Land Department (1977 Amendments to Arizona's Groundwater Code Found Constitutional).
W79-03243 6E

Water Resources Data for Arizona, Water Year 1977,
W79-03357 7C

RKANSAS
Discharge Data at Water-Quality Monitoring Stations in Arkansas, 1977 Water Year,
W79-03354 7C

RKANSAS RIVER SYSTEM
Optimization Model for the Evaluation of Flood-Control Benefits of Multipurpose Multireservoir Systems,
W79-03044 6A

RSENATE
Effects of Arsenate on Growth and Phosphorus Metabolism of Phytoplankton,
W79-03443 5C

RSENATES
Arsenic Stability in Contaminated Soils,
W79-03099 5A

RSENIC
An Automated Determination of Low Reactive Phosphorus Concentrations in Natural Waters in the Presence of Arsenic, Silicon and Mercuric Chloride,
W79-03047 5A

Arsenic Concentration in Canned Tuna Fish and Sardine,
W79-03485 5A

RSENIC COMPOUNDS
Arsenic Stability in Contaminated Soils,
W79-03099 5A

Effects of Arsenate on Growth and Phosphorus Metabolism of Phytoplankton,
W79-03443 5C

Arsenic Concentration in Canned Tuna Fish and Sardine,
W79-03485 5A

ARTIFICIAL PRECIPITATION
The Public Decides About Weather Modification,
W79-03155 3B

ARTIFICIAL RECHARGE
Predicted Water-Level and Water-Quality Effects of Artificial Recharge in the Upper Coachella Valley, California, Using a Finite-Element Digital Model,
W79-03346 4B

Well-Response Model of the Confined Area, Bunker Hill Ground-Water Basin, San Bernardino County, California,
W79-03347 4B

ARTIFICIAL SUBSTRATES
Assessing Changes in Biomass of Riverbed Periphyton,
W79-03183 5C

ASELLUS
A Comparison of the Variability of Asellus Communis (Crustacea: Isopoda) and Gammarus Pseudolimnaeus (Crustacea: Amphipoda) and Suitability for Joint Bioassays,
W79-03459 5A

ASPHALT
Water Harvesting for Afforestation: I. Efficiency and Life Span of Asphalt Cover,
W79-03133 3B

ASSESSMENT
Some Theoretical and Measurement Issues in Economic Assessment of Interbasin Water Transfers,
W79-03080 6B

ASSOCIATED COSTS
Oil Spill Liability and Compensation.
W79-03228 6E

ATLANTIC OCEAN
Shoreface-Connected Sand Ridges on American and European Shelves: A Comparison,
W79-03063 2L

ATMOSPHERE
Recent Developments in Atmospheric Chemistry,
W79-03072 2K

ATMOSPHERIC PRESSURE
Hydrology of Small Oceanic Islands - Influence of Atmospheric Pressure on the Water Table,
W79-03056 2L

ATTITUDES
Environmental Pollution Control: Two Views from the General Population,
W79-03154 5G

The Public Decides About Weather Modification,
W79-03155 3B

AUSTRALIA
PCB Residues in Mullet, Mugil Cephalus, Fed to Captive Eastern Australian Water Rats, Hydromys Chrysogaster,
W79-03484 5B

AUSTRALIAN WATER RATS
PCB Residues in Mullet, Mugil Cephalus, Fed to Captive Eastern Australian Water Rats, Hydromys Chrysogaster,
W79-03484 5B

AUTOMATIC TENSIOMETER SYSTEM
An Automatic Scanning Recording Tensiometer System,
W79-03282 2G

AVAILABLE WATER
Hydrologic Reconnaissance of theFish Springs Flat Area, Tooele, Juab, and Millard Counties, Utah,
W79-03350 4A

AVERAGE COSTS
Economic and Technical Considerations of Regional Water Supply,
W79-03140 6B

AVULSION
State of Oregon v. Corvallis Sand and Gravel Co. (Change in Location of River Bed Caused by Flood was Avulsive and did not Result in Change of Ownership of Bed),
W79-03241 6E

State Ex Rel. Dept. of Transportation V. Turnidge (State Quiets Title to Accreted Land).
W79-03245 6E

BACKWASHING
Method of Improving the Backwashing of Fixed Beds Formed of Granular Materials,
W79-03316 5D

BACTERIA
Bacterial Ecology of Strip Mine Areas and its Relationship to the Production of Acidic Mine Drainage,
W79-03104 5G

Chemical and Bacteriological Quality of Water at Selected Sites in the San Antonio Area, Texas, February 1975 - September 1977,
W79-03353 5A

Bacterial Characteristics of Activated Sludges Treating Carbohydrate Wastes,
W79-03415 5D

The Oxidation of Petroleum Hydrocarbons by Marine Bacteria,
W79-03480 5C

BALI (INDONESIA)
Ecological Studies on Indonesian Lakes, The Montane Lakes of Bali,
W79-03180 5C

BALTIC SEA
On Nutrients and Their Role as Production Limiting Factors in the Baltic,
W79-03182 5C

BANK STORAGE
Bank-Full Discharge of Rivers,
W79-03351 2E

BANKFULL DISCHARGE
Bank-Full Discharge of Rivers,
W79-03351 2E

BARLEY
Yields, Nutrient Removal, and Nutrient Concentrations of Double-Cropped Corn and Small Grain Silage,
W79-03426 3F

BARRIERS
Positive Flow Estuary Structure,
W79-03318 8B

Deployable Barrier Apron Apparatus for Use with Contaminant Recovery Systems,
W79-03328 5G

Method and Apparatus for Removing Contaminants from Bodies of Water,
W79-03332 5G

Mechanics of a Restrained Layer of Floating Oil Above a Water Current,
W79-03373 5G

BASELINE STUDIES
OCS Oil and Gas: An Assessment of the Department of The Interior Environmental Studies Program,
W79-03376 6G

BASIC DATA COLLECTIONS
Distribution and Abundance of Phytoplankton in 153 Lakes, Rivers, and Pools in the Northwest Territories,
W79-03185 5C

BASS
Acclimation Temperature and Temperature Tolerance in Fingerling Largemouth Bass (Micropterus Salmoides),
W79-03496 5G

BATHYMETRY
On the Numerical Modelling of Short Waves in Shallow Water,
W79-03292 8B

BEACH EROSION
Littoral Drift and Erosion at Belle Pass, Louisiana,
W79-03299 2L

BEACHES
Littoral Drift and Erosion at Belle Pass, Louisiana,
W79-03299 2L

BEDFORD BASIN (NOVA SCOTIA)
Temporal Variations and Probable Origins of Hydrocarbons in the Water Column of Bedford Basin, Nova Scotia,
W79-03062 2L

BENEFITS
Meramec River, Missouri, Comprehensive Basin Report, Volume VII. Appendices M through S.
W79-03170 6B

BENTHIC FAUNA
Environmental Preferences of Selected Freshwater Benthic Macroinvertebrates,
W79-03128 5A

Effect of an Organophosphorus Insecticide, Abate, Used in the Control of Simulium Damnosum on Non-Target Benthic Fauna,
W79-03174 5C

BENTHIC FLORA
Assessing Changes in Biomass of Riverbed Periphyton,
W79-03183 5C

BENTHOS
Some Patterns of Change in Lacustrine Ecosystems under Anthropogenic Influence,
W79-03479 5C

An Assessment of the Performance of Different Bottom Samplers,
W79-03495 5A

BERENDON GLACIER (CANADA)
Sedimentology of Medial Moraines on Berendon Glacier, British Columbia, Canada: Implications for Debris Transport in a Glacierized Basin,
W79-03052 2C

BIBLIOGRAPHIES
Bibliography of the Geology and Hydrology of the Albuquerque Greater Urban Area, Bernalillo and Parts of Sandoval, Santa Fe, Socorro, Torrance, and Valencia Counties, New Mexico,
W79-03339 10C

The North Carolina Coastal Zone and its Environment. A Compilation of Resource Materials Covering the Coastal Plain, Estuaries, and Offshore Waters, Volume I,
W79-03380 10C

The North Carolina Coastal Zone and its Environment. A Compilation of Resource Materials Covering the Coastal Plain, Estuaries, and Offshore Waters. Volume II,
W79-03381 10C

BIOACCUMULATION
Effects of Chromium on Some Aquatic Plants,
W79-03176 5C

Simulation Analysis of the Concentration Process of Trace Heavy Metals by Aquatic Organisms from the Viewpoint of Nutrition Ecology,
W79-03467 5B

BIOASSAY
Endrin and Malathion Toxicity to Flagfish (Jordanella Floridae),
W79-03448 5C

Test Organisms and Methods Useful for Early Assessment of Acute Toxicity of Chemicals,
W79-03450 5A

A Comparison of the Variability of Asellus Communis (Crustacea: Isopoda) and Gammarus Pseudolimnaeus (Crustacea: Amphipoda) and Suitability for Joint Bioassays,
W79-03459 5A

Sublethal Effects of West Point Treatment Plant Effluent on Coho Salmon,
W79-03461 5C

Use of Sodium Thiosulfate Dechlorinated Municipal Water in Salmon Culture,
W79-03462 5B

Effects of Holding Temperatures on Reproductive Development in Adult Sockeye Salmon (Oncorhynchus Nerka),
W79-03476 5C

Studies on Nitrite Toxicity in Rainbow Trout,
W79-03477 5C

The Survival of the Young of the Grey Mullet Mugil Saliens Risso in the Presence of Phenol,
W79-03493 5C

BIOASSAYS
Effects of Methylmercury Exposure on Sea Water Adaptation of Juvenile Coho Salmon and Steelhead Trout,
W79-03475 5C

BIOCHEMICAL OXYGEN DEMAND
Waste Water Treatment Rotor,
W79-03325 5D

TMP (Thermomechanical Pulping) Effluents -- A Review,
W79-03414 5C

BIODEGRADATION
Conifer Needle Processing in a Subalpine Lake,
W79-03400 5B

Toxicity of Carbofuran to Blue-Green Alga Nostox Muscorum,
W79-03482 5C

BIOINDICATORS
Environmental Preferences of Selected Freshwater Benthic Macroinvertebrates,
W79-03128 5A

Changes in the Aquatic Macrophyte Flora of Whitewater Lake Near Sudbury, Ontario from 1947 to 1977,
W79-03177 5C

Test Organisms and Methods Useful for Early Assessment of Acute Toxicity of Chemicals,
W79-03450 5A

Mercury Burdens in Crayfish from the Wisconsin River,
W79-03488 5A

The Technical Variability in Biotic Indices,
W79-03489 5A

BIOLOGICAL COMMUNITIES
A Comprehensive Study of Successional Patterns of Plants and Animals at Upland Disposal Areas.
W79-03257 5E

BIOLOGICAL CONCENTRATION
Effects of Selected Heavy Metals on Early Life of Sockeye and Pink Salmon,
W79-03460 5C

BIOLOGICAL TREATMENT
The Effect of Temperature Control on Biological Wastewater Treatment Processes,
W79-03110 5D

Waste Water Treatment Rotor,
W79-03325 5D

Biological Nitrification and Denitrification Using Rotating Biological Contactors,
W79-03383 5D

BIOPOND SLUDGE
Use of 'Biopond Sludge' as a Feed Ingredient for Pen-Reared Coho Salmon,
W79-03474 5G

BIOSYNTHESIS
Temporal Variations and Probable Origins of Hydrocarbons in the Water Column of Bedford Basin, Nova Scotia,
W79-03062 2L

BIOTA
A Comprehensive Study of Successional Patterns of Plants and Animals at Upland Disposal Areas.
W79-03257 5E

Hydrocarbons in the Marine Environment of Port Valdez, Alaska,
W79-03366 5C

BIOTIC INDICES
The Technical Variability in Biotic Indices,
W79-03489 5A

BISULFITE
Toxicity of Bisulfite to Protosynthesis and Respiration,
W79-03446 5C

BLACK SEA
The Effects of Sodium Lauryl Sulfate on the Sterol Fraction of Mya Arenaria,
W79-03494 5C

BLASTOCLADIELLA EMERSONII
Localization of Chitin in Algal and Fungal Cell Walls by Light and Electron Microscopy,
W79-03111 5C

BLEACHING WASTES
New Process for Treating Bleaching Effluents from Chemical Pulp Mills (Nouveau procede de traitement des effluents de blanchiment des usines de pates chimiques),
W79-03394 5D

Chlorinated and Sulfonated Degradation Products of Lignin in the Effluents from the Chlorine Bleaching of Sulfite Pulp (Chlorierte und sulfonierte Ligninabbauprodukte in Abwaessern der Chlorbleiche von Sulfitzellstoff),
W79-03405 5A

LOCK ATTRACTOR
Two Types of Fish Attractors Compared in Lake Tohopekaliga, Florida,
W79-03469 8I

LOWOUTS
Environmental Aspects of a Well Blowout in the Gulf of Mexico,
W79-03362 5C

OARD MILLS
How Two Board Mills Have Closed Their Water Systems,
W79-03390 3E

OILER FEED WATER
Studies on the Use of Coagulation Aids for Treatment of Boiler Feedwater (Cercetari privind utilizarea acceleratorilor de coagularela tratarea apelor de alimentare a cazanelor),
W79-03393 3F

OREHOLE GEOPHYSICS
Inflatable Straddle Packers and Associated Equipment for Hydraulic Fracturing and Hydrologic Testing,
W79-03342 7B

OTTOM SAMPLING
An Assessment of the Performance of Different Bottom Samplers,
W79-03495 5A

OTTOM SEDIMENTS
Toxicity in Resting Cysts of the Red-Tide Dinoflagellate Gonyaulax Excavata from Deeper Water Coastal Sediments,
W79-03447 5C

Effects of Sediment Addition on Macrobenthic Invertebrates in a Northern Canadian River,
W79-03470 5C

OUNDARY DISPUTES
Erroneously Meandered Lakeshore-The Status of the Law as it Affects Title and Distribution,
W79-03214 6E

OUNDARY LAYERS
The Damping of Solitary Waves,
W79-03295 8B

OUNDARY PROCESSES
New Nonlinear Shallow-Flow Equations with Curvature,
W79-03293 8B

OUNDARY ROUGHNESS
The Damping of Solitary Waves,
W79-03295 8B

OUNDARY WATERS
An Approach to the Optimal Control of Pollution in Boundary Waters,
W79-03195 5G

OUSSINESQ EQUATION
On the Numerical Modelling of Short Waves in Shallow Water,
W79-03292 8B

OX PLANTS
New System Improves Steam Energy Usage at Tennessee Box Plant.
W79-03387 3E

REAKWATERS
Wave Dampening Due to Rubblemound Breakwaters,
W79-03059 8B

RINES
Brine Purification Process,
W79-03319 5D

BROMACIL
Bromacil in Lakeland Soil Ground Water,
W79-03291 5B

BRUSH ATTRACTOR
Two Types of Fish Attractors Compared in Lake Tohopekaliga, Florida,
W79-03469 8I

BUNKER HILL GROUND-WATER BASIN (CALIF)
Well-Response Model of the Confined Area, Bunker Hill Ground-Water Basin, San Bernardino County, California,
W79-03347 4B

BUOYANCY
Bouyant Surface Jet in Tidal Longshore Current,
W79-03288 8B

BURNING
Process for Treating Materials Such as Combustible Sludges in a Fluidized-Bed Reactor (Procede de traitement de matieres, telles que notamment des boues combustibles, dans un reacteur a lit fluidise).
W79-03395 5E

BURNS WATERWAY HARBOR (IN)
Environmental and Economic Problems Associated with the Development of the Burns Waterway Harbor, Indiana.
W79-03157 5G

CADMIUM
Uptake of Cadmium from Phosphate Fertilizers by Peas, Radishes, and Lettuce,
W79-03424 2I

The Biogeochemistry of Heavy Metals in Polluted Lakes and Streams at Flin Flon, Canada, and a Proposed Method for Limiting Heavy-Metal Pollution of Natural Waters,
W79-03449 5C

Effects of Selected Heavy Metals on Early Life of Sockeye and Pink Salmon,
W79-03460 5C

Cadmium-Induced Phagocyte Cytoxicity,
W79-03486 5C

Toxicological Comparison of Natural and Cultured Populations of Acartia Tonsa to Cadmium, Copper and Mercury,
W79-03499 5C

CALCIUM
Calcification and Cation Sorption of Cladophora Glomerata (Chlorophyta),
W79-03445 5C

Effects of Environmental Calcium Content on Plasma Calcium Levels in Goldfish,
W79-03500 5C

CALIFORNIA
Chemical Composition of Acid Precipitation in Pasadena, Calif.,
W79-03054 5A

A Nonlinear Programming Algorithm for Real-Time Hourly Reservoir Operations,
W79-03093 4A

Evaluation of Thermograph Data for California Streams,

The Hydrothermal System of Long Valley Caldera, California,
W79-03343 4B

Predicted Water-Level and Water-Quality Effects of Artificial Recharge in the Upper Coachella Valley, California, Using a Finite-Element Digital Model,
W79-03346 4B

Well-Response Model of the Confined Area, Bunker Hill Ground-Water Basin, San Bernardino County, California,
W79-03347 4B

Measurement of Cu and Zn in San Diego Bay by Automated Anodic Stripping Voltammetry,
W79-03370 5A

CANADA
Sedimentology of Medial Moraines on Berendon Glacier, British Columbia, Canada: Implications for Debris Transport in a Glacierized Basin,
W79-03052 2C

Temporal Variations and Probable Origins of Hydrocarbons in the Water Column of Bedford Basin, Nova Scotia,
W79-03062 2L

Nutrient Runoff from Fertilized and Unfertilized Fields in Western Canada,
W79-03290 5B

Environmental Protection on Canada's West Coast,
W79-03403 5G

Pollution Control Regulations and Monitoring Technology: A Review of Research and Development from the Pulp and Paper Industry,
W79-03410 5A

Water + Weeds + Heat = Novel Experimentation,
W79-03456 5G

CAPACITY EXPANSION
A Coded Algorithm for Capacity Expansion of a Water Quality Management System,
W79-03425 5G

CAPE LOOKOUT NATIONAL SEASHORE (NC)
Ground-Water Resources of the Cape Lookout National Seashore, North Carloina,
W79-03337 2L

CAPILLARY WATER
A Soil Moisture Budget Model Accounting for Shallow Water Table Influences,
W79-03481 2G

CAPITAL
Extraction, Production and Investments in Capital and Learning, the Natural Resources Industries,
W79-03194 6B

CARBOFURAN
Toxicity of Carbofuran to Blue-Green Alga Nostox Muscorum,
W79-03482 5C

CARBOHYDRATES
Bacterial Characteristics of Activated Sludges Treating Carbohydrate Wastes,
W79-03415 5D

CARBON
Some Factors Affecting on Dry Weight, Organic Weight and Concentrations of Carbon and Nitrogen in Freshly Prepared and in Preserved Zooplankton,
W79-03184 5A

CARBON DIOXIDE
Effect of Carbon Dioxide on Pigment and Membrane Content in Synechococcus Lividus,
W79-03102 5C

Warm Springs, South Island, New Zealand, and Their Potentials to Yield Laumontite,
W79-03340 2K

Some Features of Ion Exchange in Fish During Their Adaptation to a Higher CO2 Contest in the Water,
W79-03492 5C

CARP
Some Features of Ion Exchange in Fish During Their Adaptation to a Higher CO2 Contest in the Water,
W79-03492 5C

CASPIAN SEA
Arsenic Concentration in Canned Tuna Fish and Sardine,
W79-03485 5A

CASUALTY ANALYSIS
Spill Risk Analysis Program: Methodology Development and Demonstration. Final Report,
W79-03148 5G

CATION ADSORPTION
Calcification and Cation Sorption of Cladophora Glomerata (Chlorophyta),
W79-03445 5C

CATION EXCHANGE
Potassium Uptake by Onion Roots Characterized by Potassium/Rubidium Ratio,
W79-03431 2I

CAVES
Meramec River, Missouri, Comprehensive Basin Report, Volume VII. Appendices M through S.
W79-03170 6B

CENTER-PIVOT SPRINKLERS
Dependability of Self-Propelled Sprinkler Systems,
W79-03441 3F

CENTRAL SIERRA SNOW LABORATORY
Calculated Snowpack Evaporation During Chinooks Along the Eastern Slopes of the Rocky Mountains in Alberta,
W79-03274 2D

CHANNEL FLOW
State of Oregon v. Corvallis Sand and Gravel Co. (Change in Location of River Bed Caused by Flood was Avulsive and did not Result in Change of Ownership of Bed),
W79-03241 6E

New Nonlinear Shallow-Flow Equations with Curvature,
W79-03293 8B

CHANNEL GEOMETRY
Drainage of Undulating Sandy Soils with High Groundwater Tables, I. A Drainage Formula Based on a Constant Hydraulic Head Ratio,
W79-03276 2F

CHANNELING
Water Resources Project Type Activities: Channel Modification Guidelines.
W79-03190 6E

CHANNELS
Mass Transport in a Coastal Channel, Marco River, Florida,
W79-03078 2L

Direct Solution to Problems of Open Channel Transitions,
W79-03286 8B

The Dependence of the Residual Gravity on Hydraulic Constants in Glacial Deposits,
W79-03417 2F

Effects of Sediment Addition on Macrobenthic Invertebrates in a Northern Canadian River,
W79-03470 5C

CHELATION
Concentration Effects on Separation Selectivity in Foam Fractionation,
W79-03096 5D

Application of the Rotated Disk Electrode to Measurement of Copper Complex Dissociation Rate Constants in Marine Coastal Samples,
W79-03365 5A

CHEMCONTROL
Methanol Treated Activated Sludge as an Agricultural Chemical Carrier,
W79-03262 5G

CHEMICAL ANALYSIS
An Automated Determination of Low Reactive Phosphorus Concentrations in Natural Waters in the Presence of Arsenic, Silicon and Mercuric Chloride,
W79-03047 5A

Chemical Analysis of Interstate Carrier Water Supply Systems,
W79-03259 5A

Chemical and Bacteriological Quality of Water at Selected Sites in the San Antonio Area, Texas, February 1975 - September 1977,
W79-03353 5A

CHEMICAL PROPERTIES
Recent Developments in Atmospheric Chemistry,
W79-03072 2K

Test Organisms and Methods Useful for Early Assessment of Acute Toxicity of Chemicals,
W79-03450 5A

CHEMICAL REACTIONS
Warm Springs, South Island, New Zealand, and Their Potentials to Yield Laumontite,
W79-03340 2K

CHEMICAL WASTES
Environmental Aspects of Chemical Use in Rubber Processing Operations,
W79-03008 5B

Maritime Administration Chemical Waste Incinerator Ship Project.
W79-03029 5E

Implementation of the Federal Water Pollution Control Act (Regulation and Monitoring of Toxic and Hazardous Chemicals).
W79-03237 6E

CHEMICALS
Chemical Composition of Acid Precipitation in Pasadena, Calif.,
W79-03054 5A

CHEMISTRY
Recent Developments in Atmospheric Chemistry,
W79-03072 2K

CHINOOK
Calculated Snowpack Evaporation During Chinooks Along the Eastern Slopes of the Rocky Mountains in Alberta,
W79-03274 2D

CHITIN
Localization of Chitin in Algal and Fungal Cell Walls by Light and Electron Microscopy,
W79-03111 5C

CHLORINATED HYDROCARBON PESTICIDES
The Effect of In Vivo Exposure of Endrin on the Activities of Acid, Alkaline and Glucose-6-Phosphatases in Liver and Kidney of Ophiocephalus (Channa) Punctatus,
W79-03458 5C

CHLORINATION
Ozonization of Water Containing Humic Compounds, Phenols, and Pesticides (Ozonirovaniye Vody, Soderzhashchey Guminovye Soyedineniya, Fenoly i Pestitsidy),
W79-03027 5D

Use of Sodium Thiosulfate Dechlorinated Municipal Water in Salmon Culture,
W79-03462 5B

CHLOROPHYTA
Localization of Chitin in Algal and Fungal Cell Walls by Light and Electron Microscopy,
W79-03111 5C

CHROMATOGRAPHY
Chlorinated and Sulfonated Degradation Products of Lignin in the Effluents from the Chlorine Bleaching of Sulfite Pulp (Chlorierte und sulfonierte Ligninabbauprodukte in Abwaessern der Chlorbleiche von Sulfitzellstoff),
W79-03405 5A

CHROMIC ACID
Chromic Acid in Assimilation Studies - A Caution,
W79-03468 5C

CHROMIUM
Effects of Chromium on Some Aquatic Plants,
W79-03176 5C

CITIES
Planning in Small- and Medium-Size Illinois Municipal Water Systems,
W79-03097 3D

Preliminary Listing of Municipal Water Supply Capacities,
W79-03261 3D

CITIZEN PARTICIPATION
Environmental Impact Statement Project,
W79-03041 6G

CITY PLANNING
Optimal Planning for Urban Storm Drainage Systems,
W79-03107 6A

Systematic Planning of Urban Storm-Drainage Utilities,
W79-03109 6A

CLADOPHORA
Calcification and Cation Sorption of Cladophora Glomerata (Chlorophyta),
W79-03445 5C

CLARENCE CANNON DAM (MO)
Ultimate Strain Capacity Tests, Clarence Cannon Dam, St. Louis District,
W79-03046 8F

CLASSIFICATION
A Method for the Analysis of Environmental Factors Controlling Patterns of Species Composition in Aquatic Communities,
W79-03187 5C

CLAY MINERALS
Rapid Weathering Processes of Fuel Oil in Natural Waters: Analyses and Interpretations,
W79-03363 5B

Comparison of Associations of Different Hydrocarbons with Clay Particles in Simulated Seawater,
W79-03364 5B

CLAYS
Water Purification Methods,
W79-03331 5F

CLIMATIC CHANGE
Mechanisms and Models of Climatic Change,
W79-03070 2B

Numerical Simulation of Climate and Climatic Change,
W79-03071 2B

CLIMATOLOGY
Historical Climatology,
W79-03068 2B

Tree-Ring Evidence of Past Climatic Variability,
W79-03069 2B

Mechanisms and Models of Climatic Change,
W79-03070 2B

Numerical Simulation of Climate and Climatic Change,
W79-03071 2B

Solar-Terrestrial Influences on Weather and Climate,
W79-03073 2B

Predictability of Climate,
W79-03074 2B

Predicting Temperature Trend in the Northern Hemisphere to the Year 2000,
W79-03075 2B

CLOSED SYSTEMS
The Closed-Cycle Bleached Kraft Pulp Mill,
W79-03385 3E

New System Improves Steam Energy Usage at Tennessee Box Plant.
W79-03387 3E

The Closed Water Circuit of the Alzenau Fluting Board and Paper Mill (Der geschlossene Wasserkreislauf der Wellpappen- und Papierfabrik Alzenau),
W79-03407 3E

The Closed Cycle Concept Kraft Mill at the Great Lakes Paper Co., Ltd.,
W79-03409 3E

CLOUD SEEDING
The Public Decides About Weather Modification,
W79-03155 3B

A Reanalysis of the Skagit Cloud Seeding Project,
W79-03275 3B

CLOUDS
Diurnal Variation in Rainfall and Cloudiness,
W79-03033 2B

CLUSTER ANALYSIS
A Method for the Analysis of Environmental Factors Controlling Patterns of Species Composition in Aquatic Communities,
W79-03187 5C

Data-Intensive Spatial Sampling and Multiple Hierarchical Clustering: Methodological Approaches Toward Cost/Time Efficiency in Natural Resource Assessment,
W79-03188 6A

CNP RESIDUES
Fate of Herbicides CNP in Rivers and Agricultural Drainages,
W79-03065 5B

COACHELLA VALLEY (CALIF)
Predicted Water-Level and Water-Quality Effects of Artificial Recharge in the Upper Coachella Valley, California, Using a Finite-Element Digital Model,
W79-03346 4B

COAGULATION
Studies on the Use of Coagulation Aids for Treatment of Boiler Feedwater (Cercetari privind utilizarea acceleratorilor de coagularela tratarea apelor de alimentare a cazanelor),
W79-03393 3F

Possible Use of Electrochemical Coagulation for Purification of Kraft Mill Effluents (O vozmozhnosti primeneniya metoda elektrokhimicheskoi koagulytsii dlya ochistki stochnykh vod sul'fattsellyuloznogo proizvodstva),
W79-03396 5D

COAL CONVERSON
Reduced Toxicity of an Aqueous Coal-Conversion Effluent Following Waste Disposal Treatment,
W79-03498 5C

COAL GASIFICATION
Evaluation of Pollution Control in Fossil Fuel Conversion Processes; Gasification: Section 5. BI-Gas Processes,
W79-03019 5G

COAL MINE WASTES
A Study of Coal-Associated Wastes Resulting from the Mining, Processing and Utilization of Coal,
W79-03255 5G

Microbial Sulfur Cycle Activity at a Western Coal Strip Mine,
W79-03308 5B

COALS
Evaluation of Pollution Control in Fossil Fuel Conversion Processes; Gasification: Section 5. BI-Gas Processes,
W79-03019 5G

Reduced Toxicity of an Aqueous Coal-Conversion Effluent Following Waste Disposal Treatment,
W79-03498 5C

COASTAL CHANNELS
Mass Transport in a Coastal Channel, Marco River, Florida,
W79-03078 2L

COASTAL ENGINEERING
Wave Dampening Due to Rubblemound Breakwaters,
W79-03059 8B

COASTAL PLAINS
In Situ Hydraulic Conductivity of a Fragipan Soil in the Southern Coastal Plains,
W79-03050 2G

COASTAL ZONE
The North Carolina Coastal Zone and its Environment. A Compilation of Resource Materials Covering the Coastal Plain, Estuaries, and Offshore Waters, Volume I,
W79-03380 10C

The North Carolina Coastal Zone and its Environment. A Compilation of Resource Materials Covering the Coastal Plain, Estuaries, and Offshore Waters. Volume II,
W79-03381 10C

COHO SALMON
Oxygen Consumption of Coho Salmon in a Pumped Saltwater Raceway,
W79-03473 8I

Effects of Methylmercury Exposure on Sea Water Adaptation of Juvenile Coho Salmon and Steelhead Trout,
W79-03475 5C

COLD REGIONS
Distribution and Abundance of Phytoplankton in 153 Lakes, Rivers, and Pools in the Northwest Territories,
W79-03185 5C

COLLISION AVOIDANCE
Spill Risk Analysis Program: Methodology Development and Demonstration. Final Report,
W79-03148 5G

COLOR
Effect of Organic Color and Turbidity of Secchi Disk Transparency,
W79-03304 2H

COLOR REACTIONS
Ozonization of Water Containing Humic Compounds, Phenols, and Pesticides (Ozonirovaniye Vody, Soderzhashchey Guminovye Soyedineniya, Fenoly i Pestitsidy),
W79-03027 5D

COLORADO
A Fee Simple in Water or a Trend Toward Favoring Cities. City of Grand Junction v. Kannah Creek Water Users Association, 557 P.2d 1173 (Colo. 1976),
W79-03210 6E

Federal Water Pollution Control Act Amendments of 1977 (Fort Collins, Colorado).
W79-03236 6E

People Ex Rel. Kuiper V. Winden (One Who Accepts Benefits from Sale of Water Rights is Estopped from Later Claiming Those Rights).
W79-03246 6E

Hydrologic and Geomorphic Data from the Piceance Basin, Colorado, 1972-77,
W79-03359 7C

Potential Use of Finely Disintegrated Iron Pyrite in Sodic and Iron-Deficient Soils,
W79-03423 2G

COLORADO ROCKIES
Calculated Snowpack Evaporation During Chinooks Along the Eastern Slopes of the Rocky Mountains in Alberta,
W79-03274 2D

COMMERCIAL FISHING
The Exclusive Economic Zone: A Critique of Contemporary Law of the Sea,
W79-03193 6E

Dynamic Theory of Fisheries Economics--II; Differential Game Theoretic Approach,
W79-03196 6C

W79-03217 6E

COMMUNITY DEVELOPMENT
Systematic Planning of Urban Storm-Drainage Utilities,
W79-03109 6A

COMPENSATION
Oil Spill Liability and Compensation.
W79-03228 6E

COMPETING USES
Minimum Streamflows: The Legislative Alternatives,
W79-03206 6E

COMPETITION
Concentration Effects on Separation Selectivity in Foam Fractionation,
W79-03096 5D

COMPOSTING
Composting at Johnson City: Joint USEPA-TVA Composting Project with Operational Data, 1967-1971. Volumes I and II,
W79-03032 5E

COMPREHENSIVE PLANNING
Susquehanna River Basin Study: Summary.
W79-03142 6B

Susquehanna River Basin Study: Supplement A--Plan Formulation.
W79-03143 6B

Oilspill Contingency Plan.
W79-03231 6E

Nomographs for Ten-Minute Unit Hydrographs for Small Urban Watersheds,
W79-03272 6B

Urban Runoff Control Planning,
W79-03273 6B

A Precarious Balance Upset,
W79-03432 2A

COMPUTER MODELS
Predicted Trace Metal Concentrations in Saine Seep Waters,
W79-03309 5B

COMPUTER PROGRAMS
Systematic Planning of Urban Storm-Drainage Utilities,
W79-03109 6A

Users Manual for LPTOR - A Fortran IV Linear Programming Routine,
W79-03123 7C

User's Manual for QPTOR - A Fortran IV Quadratic Programming Routine,
W79-03271 7C

CONCRETE TESTING
Ultimate Strain Capacity Tests, Clarence Cannon Dam, St. Louis District,
W79-03046 8F

CONDEMNATION
A Fee Simple in Water or a Trend Toward Favoring Cities. City of Grand Junction v. Kannah Creek Water Users Association, 557 P.2d 1173 (Colo. 1976),
W79-03210 6E

CONDENSATES
New System Improves Steam Energy Usage at Tennessee Box Plant.
W79-03387 3E

CONFERENCES
Environmental Aspects of Chemical Use in Rubber Processing Operations,
W79-03008 5B

Proceedings of the Fifth National Symposium on Food Processing Wastes.

United States Interests in a Convention on the Law of the Sea: The Case for Continued Efforts,
W79-03204 6E

The United Nations Conference of the Sea (Panel Discussion at the Annual Meeting of the American Bar Association Section of International Law),
W79-03218 6E

Law of the Sea Conference Status Report, Summe 1978.
W79-03229 6E

CONIFEROUS TREES
Conifer Needle Processing in a Subalpine Lake,
W79-03400 5B

CONJUNCTIVE PLANNING
Nomographs for Ten-Minute Unit Hydrographs for Small Urban Watersheds,
W79-03272 6B

Urban Runoff Control Planning,
W79-03273 6B

CONNECTICUT
A Record of the Accumulation of Sediment and Trace Metals in a Connecticut, U.S.A., Salt Marsh,
W79-03113 5B

PCB and the Housatonic River - A Review and Recommendations,
W79-03114 5B

Flood Plain Information: West Branch and Farmington River, Canton, New Hartford, and Barkhamsted, CT.
W79-03161 4A

CONNECTICUT RIVER (VT)
Flood Plain Information: Connecticut River, West River and Whetstone Brook, Brattleboro, VT.
W79-03162 4A

Flood Plain Information: Connecticut Riber, West River, Dummerston, VT.
W79-03163 4A

CONSTRUCTION
Soil Erosion Control on Construction Sites with Portland Cement,
W79-03058 4D

CONSTRUCTION COSTS
Cost of Social and Environmental Regulations in Construction,
W79-03191 5G

CONSTRUCTION MATERIALS
Meramec River, Missouri, Comprehensive Basin Report, Volume IV. Appendix C: Hydrology: Appendix D: Geology, Soils and Materials.
W79-03167 6B

CONTAINMENT (WASTES)
Deployable Barrier Apron Apparatus for Use with Contaminant Recovery Systems,
W79-03328 5G

CONTINENTAL SHELF
Shoreface-Connected Sand Ridges on American and European Shelves: A Comparison,
W79-03063 2L

Federal Water Pollution Control Act Amendments of 1977 (Portland, ME.).
W79-03226 6E

COOK INLET (AK)
Oceanographic Conditions in Lower Cook Inlet: Spring and Summer 1973,
W79-03077 2L

COOLANTS
PCB and the Housatonic River - A Review and Recommendations,
W79-03114 5B

COOLING TOWERS
Power Development and Water Allocation in Ohio River Basin,
W79-03057 5G

COOLING WATER
Water + Weeds + Heat = Novel Experimentation,
W79-03456 5G

Interfacing Hydrothermal and Biological Studies in Waste Heat Management,
W79-03463 5B

Environmental Implications in the Design of Cooling Water Intakes,
W79-03466 8I

COPEPODS
Toxicological Comparison of Natural and Cultured Populations of Acartia Tonsa to Cadmium, Copper and Mercury,
W79-03499 5C

COPPER
Application of the Rotated Disk Electrode to Measurement of Copper Complex Dissociation Rate Constants in Marine Coastal Samples,
W79-03365 5A

The Biogeochemistry of Heavy Metals in Polluted Lakes and Streams at Flin Flon, Canada, and a Proposed Method for Limiting Heavy-Metal Pollution of Natural Waters,
W79-03449 5C

Effects of Selected Heavy Metals on Early Life of Sockeye and Pink Salmon,
W79-03460 5C

Toxicological Comparison of Natural and Cultured Populations of Acartia Tonsa to Cadmium, Copper and Mercury,
W79-03499 5C

COPPER SULFATE
Citric Acid Enhancement of Copper Sulfate Toxicity to the Blue-Green Algae Aphanizomenon Flos-Aquae and Microcystis Aeruginosa,
W79-03037 5C

CORN
Response of Corn to Zn in Ortho- and Pyrophosphate Fertilizers, as Affected by Soil Temperature and Moisture,
W79-03399 3F

CORN BELT
Responsiveness of Soil Erosion Losses in the Corn Belt to Increased Demands for Agricultural Products,
W79-03064 3F

COST ALLOCATION
Construction Grants Program Information: Industrial Cost Recovery Systems,
W79-03252 5G

COST ANALYSIS
Cost of Sanitary Landfill Development and Operation in Illinois,
W79-03014 5G

Meramec River, Missouri, Comprehensive Basin Study, Volume VIII. Appendix T: Detailed Cost Estimates.
W79-03171 6B

COST-BENEFIT ANALYSIS
Some Theoretical and Measurement Issues in Economic Assessment of Interbasin Water Transfers,
W79-03080 6B

COST MINIMIZATION
Regional Water Supply Functions,
W79-03088 6A

Inter-District Water Allocations Via Linear Programming and Linear Programming Decomposition,
W79-03091 4A

A Coded Algorithm for Capacity Expansion of a Water Quality Management System,
W79-03425 5G

COSTS
Cost of Sanitary Landfill Development and Operation in Illinois,
W79-03014 5G

Commercial Sailing Vessels - An Economic Assessment,
W79-03192 6B

Trade-Offs Between Erosion Control and Production Costs in U.S. Agriculture,
W79-03284 4D

CRAYFISH
Mercury Burdens in Crayfish from the Wisconsin River,
W79-03488 5A

CREEL CENSUS
Two Types of Fish Attractors Compared in Lake Tohopekaliga, Florida,
W79-03469 8I

CROP PRODUCTION
Sugarbeet Genotype, N, and Soil Moisture Availability Interactions in Components of Beet Yield and Quality,
W79-03418 3F

CROP RESPONSE
A Meteorological approach to the Identification of Drought Sensitive Periods in Field Crops,
W79-03130 2B

CRUSTACEANS
A Comparison of the Variability of Asellus Communis (Crustacea: Isopoda) and Gammarus Pseudolimnaeus (Crustacea: Amphipoda) and Suitability for Joint Bioassays,
W79-03459 5A

CULTIVATION
Row Spacing and Direction Effects on Water Uptake Characteristics of Peanuts,
W79-03094 3F

CURRENTS (WATER)
Bouyant Surface Jet in Tidal Longshore Current,
W79-03288 8B

Mechanics of a Restrained Layer of Floating Oil Above a Water Current,
W79-03373 5G

CYANIDES
Selective Removal of Iron Cyanide Anions from Fluids Containing Thiocyanates,
W79-03322 5D

CYANOBACTERIA
Effect of Carbon Dioxide on Pigment and Membrane Content in Synechococcus Lividus,
W79-03102 5C

CYANOPHYTA
Citric Acid Enhancement of Copper Sulfate Toxicity to the Blue-Green Algae Aphanizomenon Flos-Aquae and Microcystis Aeruginosa,
W79-03037 5C

Effect of Carbon Dioxide on Pigment and Membrane Content in Synechococcus Lividus,
W79-03102 5C

Toxicity of Carbofuran to Blue-Green Alga Nostox Muscorum,
W79-03482 5C

CYCLES
Are Deserts Man-Made,
W79-03436 2B

CYTOLOGICAL STUDIES
Cadmium-Induced Phagocyte Cytoxicity,

Performance Evaluation of Guildline Model 8400 Laboratory Salinometer,
W79-03270 7B

SALMON
Effects of Selected Heavy Metals on Early Life of Sockeye and Pink Salmon,
W79-03460 5C

Sublethal Effects of West Point Treatment Plant Effluent on Coho Salmon,
W79-03461 5C

Use of 'Biopond Sludge' as a Feed Ingredient for Pen-Reared Coho Salmon,
W79-03474 5G

SALT BALANCE
Salt Outflows from New and Old Irrigation Lands,
W79-03442 3C

SALT MARSHES
Effects of Mosquito Control Ditching on Juncus Marshes and Utilization of Mosquito Control Ditches by Estuarine Fishes and Invertebrates,
W79-03023 5G

A Record of the Accumulation of Sediment and Trace Metals in a Connecticut, U.S.A., Salt Marsh,
W79-03113 5B

Factors Regulating the Distribution and Population Dynamics of the Amphipod Gammarus Palustris in an Intertidal Salt Marsh Community,
W79-03116 2I

SALTS
Salt Outflows from New and Old Irrigation Lands,
W79-03442 3C

SAMPLING
A Comparison of Discrete and Intensive Sampling for Measuring the Loads of Nitrogen and Phosphorus in the River Main, County Antrim,
W79-03066 5A

Actinide Activities in Water Entering the Northern North Sea,
W79-03067 5A

Data-Intensive Spatial Sampling and Multiple Hierarchical Clustering: Methodological Approaches Toward Cost/Time Efficiency in Natural Resource Assessment,
W79-03188 6A

SAN ANTONIO AREA (TEX)
Chemical and Bacteriological Quality of Water at Selected Sites in the San Antonio Area, Texas, February 1975 - September 1977,
W79-03353 5A

SAN DIEGO BAY (CA)
Measurement of Cu and Zn in San Diego Bay by Automated Anodic Stripping Voltammetry,
W79-03370 5A

SAND WAVES
Shoreface-Connected Sand Ridges on American and European Shelves: A Comparison,
W79-03063 2L

SANDS
Series Intermittent Sand Filtration of Wastewater Lagoon Effluents,
W79-03089 5D

Drainage of Undulating Sandy Soils with High Groundwater Tables, I. A Drainage Formula Based on a Constant Hydraulic Head Ratio,
W79-03276 2F

Drainage of Undulating Sandy Soils with High Groundwater Tables, II. The Variable Hydraulic Head Ratio,
W79-03277 2F

SANDSTONE AQUIFER (WIS)
Dissolved-Solids Concentrations of Water in the Sandstone Aquifer, Wisconsin,
W79-03341 7C

SANITATION
A Community Surveys its Sanitation Problems,
W79-03098 5G

SANTA CRUZ RIVER BASIN (ARIZ)
Alternatives for Managing a Finite Groundwater Supply in an Arid Region,
W79-03131 4B

SANTA CRUZ VALLEY (ARIZ)
Gravity Analysis of the Subsurface Structure of the Upper Santa Cruz Valley, Santa Cruz County, Arizona,
W79-03002 2F

SARDINES
Arsenic Concentration in Canned Tuna Fish and Sardine,
W79-03485 5A

SAROTHERODON
Chromic Acid in Assimilation Studies - A Caution,
W79-03468 5C

SASKATCHEWAN (CANADA)
Nutrient Runoff from Fertilized and Unfertilized Fields in Western Canada,
W79-03290 5B

SATELLITES (ARTIFICIAL)
Measurement of Ocean Wave Heights Using the Geos 3 Altimeter,
W79-03076 7B

Applications of Seasat to the Offshore Oil, Gas, and Mining Industries,
W79-03374 5G

SCHEDULING
Program Objectives for the National Water Data Exchange (NAWDEX) for Fiscal Year 1979,
W79-03348 10D

SCHOOL (EDUCATION)
School Water Supply Fluoridation,
W79-03260 5F

SCREENS
Float-Wash System. Closing of the Water Circulation System in the Pulp and Paper Industry (Float-Wash System. Schliessen des Wasserkreislaufes in der Zellstoff- und Papierindustrie),
W79-03406 5D

SEA ICE
Will Deserts Drink Icebergs,
W79-03437 2C

SEA-LEVEL FLUCTUATIONS
Hydrology of Small Oceanic Islands - Influence of Atmospheric Pressure on the Water Table,
W79-03056 2L

SEA WATER
Interaction Between the West Arabian Sea and the Indian Monsoon,
W79-03135 2B

SEA WATER ADAPTATION
Effects of Methylmercury Exposure on Sea Water Adaptation of Juvenile Coho Salmon and Steelhead Trout,
W79-03475 5C

SEASAT-1
Applications of Seasat to the Offshore Oil, Gas, and Mining Industries,
W79-03374 5G

SEASONAL
The Technical Variability in Biotic Indices,
W79-03489 5A

SECCHI DISKS
Effect of Organic Color and Turbidity of Secchi Disk Transparency,
W79-03304 2H

SEDIMENT DISTRIBUTION
Loess Deposits Associated with Deserts,
W79-03138 2J

SEDIMENT LOAD
Effects of Sediment Addition on Macrobenthic Invertebrates in a Northern Canadian River,
W79-03470 5C

SEDIMENT TRANSPORT
Nearshore Disposal: Onshore Sediment Transport,
W79-03382 5B

SEDIMENT YIELD
Hydrologic and Geomorphic Data from the Piceance Basin, Colorado, 1972-77,
W79-03359 7C

SEDIMENTATION RATES
A Record of the Accumulation of Sediment and Trace Metals in a Connecticut, U.S.A., Salt Marsh,
W79-03113 5B

SEDIMENTS
Significance of Turbidity for Quality Assessment of Agricultural Runoff and Irrigation Return Flow,
W79-03006 5A

Sedimentology of Medial Moraines on Berendon Glacier, British Columbia, Canada: Implications for Debris Transport in a Glacierized Basin,
W79-03052 2C

Comparison of Associations of Different Hydrocarbons with Clay Particles in Simulated Seawater,
W79-03364 5B

Hydrocarbons in the Marine Environment of Port Valdez, Alaska,
W79-03366 5C

Light Hydrocarbons in Recent Texas Continental Shelf and Slope Sediments,
W79-03371 5B

SEEPAGE
Predicted Trace Metal Concentrations in Saine Seep Waters,
W79-03309 5B

SEPARATION TECHNIQUES
Selective Removal of Iron Cyanide Anions from Fluids Containing Thiocyanates,
W79-03322 5D

Method for Recovering Variable-Valency Elements and Purifying Sewage Waters,
W79-03330 5D

SEWAGE
Sublethal Effects of West Point Treatment Plant Effluent on Coho Salmon,
W79-03461 5C

SEWAGE SLUDGE
Municipal Sludge Management: EPA Construction Grants Program, An Overview of the Sludge Management Situation,
W79-03011 5D

Destruction of Polychlorinated Biphenyls in Sewage Sludge During Incineration,

A Recycled-Water Sanitary Waste Disposal System,
W79-03034 5D

WEST VIRGINIA UNIV., MORGANTOWN. COAL RESEARCH BUREAU.
A Study of Coal-Associated Wastes Resulting from the Mining, Processing and Utilization of Coal,
W79-03255 5G

WEST VIRGINIA UNIV., MORGANTOWN. DEPT. OF GEOLOGY AND GEOGRAPHY.
A Hydrologic Study of Water Well Yields and GroundWater Quality Related to Stratigraphic and Structural Settings in Western Jackson County, West Virginia,
W79-03306 5A

WESTERN NATURAL RESOURCES FOUNDATION, SALT LAKE CITY, UT.
State Laws and Instream Flows,
W79-03120 6E

WEYERHAUSER CO., SEATTLE, WA.
Oxygen Consumption of Coho Salmon in a Pumped Saltwater Raceway,
W79-03473 8I

WEYERHAUSER CO., SEATTLE, WA.

Use of 'Biopond Sludge' as a Feed Ingredient for Pen-Reared Coho Salmon,
W79-03474 5G

WEYERHAUSER CO., SPRINGFIELD, OR.
Use of Sodium Thiosulfate Dechlorinated Municipal Water in Salmon Culture,
W79-03462 5B

WISCONSIN DEPT. OF NATURAL RESOURCES, MADISON. BUREAU OF WATER QUALITY.
Mercury Burdens in Crayfish from the Wisconsin River,
W79-03488 5A

WISCONSIN UNIV. MADISON. LAND RESOURCES.
Utility Line Siting and Wetland Preservation,
W79-03090 4C

WISCONSIN UNIV., MILWAUKEE. CENTER FOR GREAT LAKES STUDIES.
Calcification and Cation Sorption of Cladophora Glomerata (Chlorophyta),
W79-03445 5C

YALE UNIV., NEW HAVEN, CT.
A Record of the Accumulation of Sediment and Trace Metals in a Connecticut, U.S.A., Salt Marsh,
W79-03113 5B

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

SELECTED WATER RESOURCES ABSTRACTS

The Library of the
University of Illinois
at Urbana Champaign

VOLUME 12, NUMBER 8
APRIL 15, 1979

W79-03501--W79-04000
CODEN:SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 12, NUMBER 8
APRIL 15, 1979

W79-03501--W79-04000

e Secretary of the U.S. Department of the Interior has de-
rmined that the publication of the periodical is necessary in the
nsaction of the public business required by law of this Depart-
ment. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development

07 RESOURCES DATA
Includes the following Groups: Network Design, Data Acquisition; Evaluation, Processing and Publication

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

1A. Properties

ALIPHATIC ACID ANIONS IN OIL-FIELD WATERS--IMPLICATIONS FOR ORIGIN OF NATURAL GAS,
Geological Survey, Menlo Park, CA. Water Resources Div.
W. W. Carothers, and Y. K. Kharaka.
The American Association of Petroleum Geologists Bulletin, Vol. 62, No 12, p 2441-2453, December 1978. 5 fig, 1 tab, 37 ref.

Descriptors: *Organic acids, *Subsurface waters, *Oil fields, *Natural gas, *Chemical reactions, Geology, Temperature, Depth, Chemical analysis, Alkalinity, Ions, Texas, California, *Origin of natural gas, *Formation waters, *Acetate, *Decarboxylation, Proximity indicator, San Joaquin Valley, Brazoria County, Galveston County.

Concentrations of short-chain aliphatic acid anions (acetate, propionate, butyrate, and valerate) in 95 formation-water samples from 15 oil and gas fields in San Joaquin Valley, California, and Houston-Galveston and Corpus Christi areas, Texas, show three temperature regimes. The reservoir rocks consist of marine sandstones ranging in age from Eocene through Miocene. The aliphatic acid anions of formation waters in zone 1 (subsurface temperatures lower than 80 C) are characterized by concentrations less than 60 micrograms per liter and consist predominantly of propionate. The concentrations of aliphatic acid anions in zone 2 (temperatures 80 to 200 C) are much higher (up to 4,865 micrograms per liter) than in zone 1 and decrease with increasing subsurface temperatures and age of their reservoir rocks. Acetate forms more than 90 percent of the total anions. No aliphatic acid anions are believed present in zone 3 where the temperatures are higher than 200 C. Microbiological degradation of acetate and dilution by mixing with meteoric water most likely explain the composition and concentration of aliphatic acid anions in zone 1. The trends in zone 2 and the absence of acid anions in zone 3 are explained by thermal decarboxylation of these acid anions. Aliphatic acid anions generally contribute more than 50 percent and up to 100 percent of the measured alkalinity in the samples of zone 2. Their contributions to the alkalinity in zones 1 and 3 are small. The aliphatic acid anions mainly result from the thermocatalytic degradation of kerogen. (Woodard-USGS)

FRESH GROUNDWATER BENEATH CONTINENTAL SHELF: FINDINGS OF ATLANTIC CONTINENTAL-MARGIN DRILLING PROGRAM,
Geological Survey, Woods Hole, MA. Water Resources Div.
F. A. Kohout, M. H. Bothner, and F. T. Manheim.
American Association of Petroleum Geologists Bulletin, Vol. 61, No. 5, p. 804, May 1977.

Descriptors: *Freshwater, *Groundwater, *Continental shelf, *Atlantic Ocean, *Northeast U.S., *Southeast U.S., Drilling, Test wells, Sampling, Water analysis, Water quality, Salinity, Connate water, Marine geology, *Offshore drilling.

The drilling of 22 test holes on the Atlantic Outer Continental Shelf has for the first time provided a semiquantitative picture of fresh groundwater in offshore areas. Salinity of subseafloor sediments was determined from 175 samples of interstitial water squeezed from sediment cores with a hydraulic press. Data from 5 of the test holes on a transect across the shelf from the New Jersey coast permitted construction of a cross section through the lens of relatively fresh water and the transition zone to seawater. The cross section indicates that low-salinity water (less than 2 parts per thousand) extends more than 16 km offshore and that salinities below 6 parts per thousand extend more than 100 km from shore. (Woodard-USGS)
W79-03562

ORIGIN OF FRESH GROUND WATER BENEATH THE U.S. ATLANTIC CONTINENTAL SHELF,
Geological Survey, Woods Hole, MA. Water Resources Div.
F. A. Kohout, F. T. Manheim, M. H. Bothner, and D. F. Delaney.
Ground Water, Vol 16, No 5, p 360, September-October 1978.

Descriptors: *Freshwater, *Groundwater, *Continental shelf, *Atlantic Ocean, *Northeast U.S., *Southeast U.S., Drilling, Test wells, Water analysis, Reviews, Aquifers, Groundwater movement, Connate water, Salinity, Marine geology, *Offshore drilling.

An understanding of the distribution of fresh ground water and the nature of the transition zone to sea water in aquifers underlying the Continental Shelf is beginning to emerge from pre-water studies. On Long Island and extending south to Florida, recharge is known to pass from surficial deposits into underlying aquifers. Although continous flow systems from mainland to offshore aquifers may exist, calculations by H. R. Henry (1962) suggest that even in the relatively permeable limestones of the Floridan aquifer, adjustment of the salt front to a condition of hydrodynamic equilibrium with the present level of the sea would require in excess of 30,000 years. (Woodard-USGS)
W79-03589

FRESH GROUND WATER FOUND DEEP BENEATH NANTUCKET ISLAND, MASSACHUSETTS,
Geological Survey, Woods Hole, MA. Water Resources Div.; and Geological Survey, Boston, MA. Water Resources Div.
F. A. Kohout, E. H. Walker, M. H. Bothner, and J. C. Hathaway.
Journal of Research of the US Geological Survey, Vol 4, No 5, p 511-515, September-October 1976. 2 fig, 21 ref.

Descriptors: *Freshwater, *Groundwater, *Continental shelf, *Massachusetts, *Islands, Test wells, Deep wells, Aquifers, Connate water, Sampling, Groundwater movement, Water analysis, Water quality, Salinity, Marine geology, Evaluation, *Nantucket Island, Glacial outwash.

In a deep water-resources and stratigraphic test well near the center of Nantucket Island, about 30 miles off the New England coast, freshwater has been found at greater depths than predicted by the Ghyben-Herzberg principle. An uppermost lens of freshwater, which occupies relatively permeable glacial-outwash sand gravel to a depth of 520 feet, is believed to be in hydrodynamic equilibrium with the present level of the sea and the height of the water table. However, two zones of freshwater at 730 to 820 ft and 900 to 930 ft are anomalously deep. Although several explanations are piossible, the most likely is that the entire surface of the Continental Shelf was exposed to recharge by precipitation during long periods of low sea level in Pleistocene time. After the last retreat of glacial ice, seawater rapidly drowned the shelf around Nantucket Island. Since then, about 8,000 years ago, the deep freshwater zones which underlie dense clay layers have not had time to adjust to a new equilibium. Under similar circumstances, freshwater may remain trapped under extensive areas of the Coontinental Shelf wherever clay confining beds have not permitted saltwater to intrude rapidly to new hydrodynamic equilibra positions. (Woodard-USGS)

CLIMATE, CLIMATIC CHANGE, AND WATER SUPPLY,
National Research Council, Washington, DC.
Studies in Geophysics. National Academy of Sciences, Washington, D.C., 1977. 132 p, 58 fig, 31 tab, 320 ref. Panel on Water and Climate, National Research Council.

Descriptors: *Water supply, *Climate, *Climatic change, *Socio-economic aspects, *Water resources, *Design, Methodology, Estimating, Forecasting, Water demand, Water shortage, Planning, Effects, Colorado River basin, Southwest U.S., Northeast U.S., Optimization, Mathematical models, Systems analysis, Transfer-function analysis, Bibliographies.

This volume contains essays presented at an American Geophysical Union meeting in Washington, D.C., in April 1976. Evaluated are the interactions between hydrology, water supply, climate, and climatic change. Areas where deficiencies in knowledge and data make rational water resource decision making more difficult than it need be are highlighted. Represented are authors from diverse disciplines, and the subject matter covers a wide-ranging area. The volume is divided into three sections. The first deals with climatology, the second with socio-economic aspects, and the third with water resource design and practice. Considered are: (1) water supply and the future climate; (2) the interpretation of past climatic variability from paleoenvironmental indicators; (3) methods for estimating and projecting water demands; (4) climatic change and water law; (5) identification of economic and societal impacts of water shortages; (6) water resources systems planning; (7) water supply sensitivity of the Northeast to climatic change; and (8) impact on the Colorado River basin and Southwest water supply. Utilized are techniques such as transfer-function analysis, linear programming, and demand estimation. (See W79-03528 and W79-03529) (Bell-Graf--Cornell)

CLIMATOLOGICAL AND PHYSICAL CHARACTERISTICS AFFECTING AVIAN POPULATION ESTIMATES IN SOUTHWESTERN RIPARIAN COMMUNITIES USING TRANSECT COUNTS,
Arizona State Univ., Tempe. Dept. of Zoology; and Arizona State Univ., Tempe. Center for Environmental Studies.
B. W. Anderson, and R. D. Ohmart.
In: Importance, Preservation and Management of Riparian Habitat: A Symposium, July 9, 1977, Tuscon, Arizona. USDA Forest Service General Technical Report RM-43, p. 193-200. 2 fig, 6 tab, 2 ref.

Descriptors: *Birds, *Census, Climates, *Methodology, Southwest U.S., Colorado River, Riparian land, Winds, Seasonal, Wetlands, Rivers, Mesquite.

Comparative data from about 20,000 censuses of line transects on the lower Colorado River show that strong winds (20 to 50 kmph) may reduce censusing accuracy but winds below 20 kmph appear not to strongly influence avian estimates. In winter, optimum censusing time is from 1 hour after sunrise to 2.5 hours after sunrise, whereas in summer the optimum period is 0.25 hours before sunrise to 1 hour after sunup. Consecutive censuses from the same area by highly experienced observers (> 5 years of birding) are more consistent than less experienced personnel (10 to 16 months of birding). Each transect should be censused at least twice monthly for minimum best density estimates and three times for maximum best density estimates and three times for minimum best avian species diversity estimates. Four census reveal a greater number of species than with two or three censuses. Number of transects needed for a minimum adequate sample of 3,200 ha of mature honey mesquite (Prosopis juliflora) habitat is four (sampled three times monthly) but for more precise population data for each species six to nine are required. 2C. Snow, Ice, and Frost

SOIL - MOISUTRE - TEMPERATURE FOR ALASKAN LOWLAND,
Alaska Univ., Fairbanks
G. L. Guymon
Journal of Irrigation and Drainage Division, ASCE, Vol. 101, No. IR3, p 187-199, September 1975. 5 fig, 13 ref. OWRT C-4049(No 9010)(2).

Descriptors: Soil investigations, *Permafrost, *Alaska, *Soil types, *Frozen soils, *Soil moisture, Soil moisture meters, *Soil temperature, Soil water movement, Soil profiles, Frost, On site investigations, Soil pressure, Pore pressure.

Field work was conducted at four sites in Goldstream Valley north of Fairbanks, Alaska, to obtain soilwater pressure and temperature data from (1) a lowland suprapermafrost soil adjacent to a stream, and (2) a lowland tussock soil underlain by shallow permafrost. Instrumentation at the sites consisted of tensiometer arrays for measuring pore-water pressures in the unsaturated soil zone, thermistor arrays for recording soil temperatures, and probes to determine frost depths. Data analysis shows that the annual soil-moisture and temperature patterns are a complex sequence of events. Soil-moisture-temperature relationships are discussed for summer, winter and spring. It is concluded that moisture movement in soils of extremely cold climates is a complex and dynamic process during the winter freezing period. (Davison-IPA)
W79-03582

PHYSICAL METHODS OF STUDYING ICE AND SNOW,
Army Terrestrial Science Center, Hanover, NH.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A030 818, Prices codes: A11 in paper copy, A01 in microfiche. CRREL Draft Translation 539, August 1976. 246 p. Translated from Trudy Arkticheskii i Antarkticheskii Nauchno-Issledovatel'skii Institute, Lenigrad (USSR), Vol. 326, 1975. 228 p. V.V. Bogorodskiy, and V.P. Gavrilo, editors.

Descriptors: *Remote sensing, *Ice, *Sea ice, *Snow, Ice cover, Snow cover, Surveys, Instrumentation, Equipment, Radio, Radio waves, Radiation, Acoustics, Sounding, Strength of materials, Structures, Mechanical properties, Physical properties, Cold regions, Cold weather construction, *Conferences, *USSR, Ice breakup.

Proceedings of a scientific symposium organized by the Order of Lenin Arctic and Antarctic Scientific Research Institute and the International Commission for Antarctic Research, Earth Sciences Section, Presidium of the USSR Academy of Sciences, which was held in Leningrad on 1-5 October 1973, were published in this anthology. These articles by Soviet and foreign scientists reflect the results of research conducted in recent years on the following directions: (1) electromagnetic methods for analyzing snow and ice, active and passive radar analysis of ice and snow cover; (2) optical methods for analyzing snow, ice, and water; and (3) dynamic and static methods for analyzing the mechanical properties of ice and snow. (See W79-03597 thru W79-03633) (Sims-ISWS)
W79-03596

RADIOPHYSICAL METHODS FOR ANALYZING ICE AND SNOW,
V. V. Bogorodskiy.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 4-11, August 1976. 2 fig, 1 tab, 6 ref.

Descriptors: *Remote sensing, *Ice cover, *Glaciers, Radio waves, Light, Physical properties, Topography, Topography mapping, Sea ice, Ice, Maps, Glaciology, *USSR, Subglacial relief.

The present state of problems in ice and snow and snow physics that have been solved or are presently being solved by radiophysical methods of analysis was dicussed. Special attention was devoted to research on electromagnetic characteristics of various types of ice and to radio sounding of ice cover, radio thermolocation of ice and snow cover, ice optics, and the mechanical characteristics of ice. Problems pertaining to the stressed state of ice cover, including reseach on glacier movement parameters, were examined. (See also W79-03596) (Sims-ISWS)
W79-03597

FM RADAR SIGNALS REFLECTED FROM ICE SURFACES, AND THE POSSIBILITIES FOR MODELING THEM,
A. B. Babayev, V. P. Logachev, V. N. Parfent'yev, V. A. Fedorov, and G. P. Shelomanova.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 12-16, August 1976. 1 fig, 1 tab, 2ref.

Descriptors: *Remote sensing, *Ice, *Ice cover, *Radio waves, Model studies, Mathematical models, Sea ice, Lake ice, Surface waters, Freshwater, Reflectance, Electrical properties, Engineering, Electrical engineering.

Properties of FM signals reflected from ice surfaces were analyzed on the basis of theoretical and experimental data. The elctrophysical properties of ice and its roughness were taken into account. The possibility of modeling such a signal under laboratory conditions was examined. Possibilities were established for obtaining information on ice thickness using an FM signal. (See also W79-0396) (Sims-ISWS)
W79-03598

EFFECT OF ICE STRUCTURE ON ITS RADIATION CHARACTERISTICS IN THE SHF RANGE,
A. Ye. Basharinov, and A. A. Kurskaya
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 17-19, August 1976. 1 fig, 4 ref.

Descriptors: *Ice, *Remote sensing, *Radio waves, Ice cover, Radiation, Thermal radiation, Microwaves, Model studies, Mathematical models, On-site investigations, On-site data collections, Sea ice, Glaciers, Radiothermal emission.

Observed data were compared with model computations permitting evaluation of the porosity of an ice layer. In relation to the measured spectrums of the emissivity of polar sea ice, the ice porosity was assessed at an air inclusion concentration of 50-100 cu cm. Data from radiation measurements showed that the concentration of air inclusions in young ice does not exceed 5-15kcu cm. The observed abnormalities in the shape of the radiothermal emission spectrum of shelf ice on antarctica, manifesting themselves as a reduction in blackness in the centimeter range, were explained by a model of an ice layer containing water lenses. (See also W79-03596) (Sims-ISWS)
W79-03599

PROPAGATION OF RADIO WAVES IN GLACIERS,
V. V. Bogorodskiy, G. V. Trepov, and B. A. Fedorov.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 20-25, August 1976.

Descriptors: *Radio waves, *Radar, *Glaciers, *Remote sensing, Electromagnetic waves, Ice, Ice cover, Model studies, Analytical techniques, Glaciology, Electrical engineering, Polarization.

The components of radar signal attenuation stemming from focusing (defocusing) and depolarization were analyzed. Measurements of the intensity of reflected signals and analyses of fluctuations in their intensity as well as analyses of depolarization phenomena in signals propagating through a glacier were discussed. (See also W79-03596) (Sims-ISWS)

RADIO SOUNDING OF SEA ICE,
V. V. Bogorodskiy, and V. P. Tripol'nikov
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 26-28, August 1976. 1 fig, 4 ref.

Descriptors: *Sea ice, *Sounding, *Radio waves, Laboratory tests, On-site investigations, Electromagnetic waves, Ice, Snow cover, Remote sensing, Physical properties, Ice-water interfaces, Signal velocity, Wave velocity.

Analysis of the electromagnetic characteristics of sea ice in the 40-440 MHz range demonstrated the promise of using this range for radar sounding of sea ice. Representation of the velocity of a radar signal in sea ice is a significant aspect of this problem. It was demonstrated with artificial samples of sea ice that the velocity of electromagnetic waves in sea ice depends on the relative concentration of liquid and solid phases. Analysis of wave velocities in natural sea ice confirms this result. Therefore, when making radar surveys of sea ice thickness, the temperature conditions and classification of ice must be taken into account in parallel. (See also W79-03596) (Sims-ISWS)
W79-03601

EMISSIVITY O ICE, TERRESTRIAL, AND SEA SURFACES MODELED BY STRATIFIED HETEROGENEOUS STRUCTURES.
V. V. Bogorodskiy, A. I. Koslov, and L. T. Tuchkov
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 29-35, August 1976. 2 fig, 14 ref

Descriptors: *Model studies, *Mathematical models, *Radio waves, *Remote sensing, Ice, Oceans, Land, Electromagnetic waves, Radiation, Thermal radiation, Temperature, Radiothermal emission, Polarization, Radiant temperature.

Some electrodynamic models of terrestrial, sea, and ice surfaces were proposed and studied. The models were built by successive introduction of electric and geometric irregularities into a stratified structure, both at the interfaces and within it, leading to formation of models of four classes: (1) with surface electric irregularities; (2) with electric irregularities within the layer; (3) with geometric irregularities at the boundary; and (4) with internal geometric irregularities. Research on the emission characteristics of the examined models was presented to clarify the dependence between their radiant temperature and the electrophysical, geometric, and statistical properties; and recommendations were given on model selection. (See also W79-03596) (Sims-ISWS)
W79-03602

MEASUREMENT OF REFLECTED SIGNALS DURING RADAR SOUNDING IN A LARGE RANGE OF ANGLES,
Z. Klau Dzh.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539. Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 36-41, August 1976. 3 fig, 8 ref.

Descriptors: *Remote sensing, *Radar, *Snow, *Ice, *Antarctic, Radio waves, Reflectance, Sounding, Ice cover, Snow cover, Glaciers, On-site investigations.

This article presented the results of an analysis of ray pattern in research on the nature of echo signal recordings made in a large range of angles. A description was given of three potential sources of error in measuring the reflection velocity of signals. Examples of detailed measurements of reflected signals in a broad range of angles in 1967 at the coast of eastern Antarctica and in 1970 in the vicinity of Byrd Station were presented. ELECTRIC PROPERTIES OF ICE FORMED IN A VACUUM, AND THEIR RELATIONSHIP TO STRUCTURE,
A. K. Zhebrovskiy, G. M. Strakhovskiy, V. N. Nedostayev, and V. I. Stebin.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 52-55. August 1976. 1 fig, 1 ref.

Descriptors: *Ice, *Electrical properties, *Laboratory tests, Crystals, Air pressure, Temperature, Crystal growth, Freezing, Particle size, Measurements, Dielectric permeability.

Experimental results obtained by measuring the dielectric permeability of samples of ice formed in a vacuum chamber were analyzed depending upon structure and vapor pressure (0.0001-0.01 torr) in a frequency range from 0 to 1,000 Hz. The dominant factor in relation to both pure ice and ice formed in a vacuum is the condition under which the ice forms. Ice formed out of the vapor phase consists of polycrystals with a fine-grained structure. Grain size varies within 0.2-0.3 micrometers. The size of the forming grains depends upon the water vapor pressure. As pressure increases, the size of the grains grows. Grain size has a considerable influence on electric properties of ice obtained in a vacuum. Enlargement of grains by about two times causes approximately a 30% increase in dielectric permeability. (See also W79-03596) (Sims-ISWS)
W79-03606

ICE PRESSURE ON SEPARATELY STANDING SUPPORTS IN LABORATORY AND NATURAL TESTS,
S. A. Vershinin, Ye. M. Kopaygorodskiy, V. V. Panov, and Z. I. Shvayshteyn.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 63-68, August 1976. 3 fig, 2 ref.

Descriptors: *Sea ice, *Laboratory tests, *Optical properties, *Salinity, Transmissivity, Light, Ice, Properties, Physical properties, Extinction factor, Transmission factor.

This article presented some results of laboratory and natural tests to determine the action of ice upon vertical supports of hydraulic engineering structures in the presence of moving ice fields. When planning hydraulic engineering structures, the size of the limiting load is taken into account by introduction of coefficient K, which varies (from 1.5 to 7) depending on the geometric parameters of the structure and ice thickness. (See also W79-03596)(Sims-ISWS)
W79-03607

EFFECT OF SEA ICE SALINITY ON OPTICAL EXTINCTION AT WAVELENGTH 6,328 A,
Kh. Devis, and R. M'yunis.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 63-68, August 1976. 3 fig, 2 ref.

Descriptors: *Sea ice, *Laboratory tests, *Optical properties, *Salinity, Transmissivity, Light, Ice, Properties, Physical properties, Extinction factor, Transmission factor.

The results of research on the dependence between the extinction factor and sea ice salinity were presented. Optical extinction factors were computed, and the dependence between the extinction factor and measured ice salinity was set up. An experiment revealed presence of an exponential dependence between the extinction factor and ice salinity. This dependence can be described by the formula $y = 2.41 + 0.001 \exp(1.19x)$, where y is the extinction factor and x is ice salinity. (See also W79-03596)(Sims-ISWS)
W79-03608

OPTICAL CHARACTERISTICS OF SOME VARIETIES OF NATURAL ICE,
B. Ya. Gayskhoki.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 69-72, August 1976. 1 fig, 2 ref.

Descriptors: *Ice, *Optical properties, *Laboratory tests, Sea ice, Light, Energy transfer, Transmissivity, Reflectance, Properties, Physical properties, Transmission factor, Reflection factor, Ice types.

The results of experimental research on optical characteristics of sea and freshwater ice were examined. The diffuse transmission and reflection factors of ice samples were measured in some portions of the spectrum in the 360-1,000 nanometer wavelength range. The relative scattering indicatrix was determined at a wavelength of 6,328 A. The dependence of optical characteristics on the structure and composition of natural ice was examined. (See also W79-03596) (Sims-ISWS)

THE PROBLEM OF STUDYING CHARGE GENERATION ON THE PHASE INTERFACE OF 0.001 MOLAR SODIUM CHLORIDE SOLUTION UNDERGOING DIRECTED FREEZING,
V. Petera.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 79-87, August 1976. 4 fig, 1 tab, 9 ref.

Descriptors: *Freezing, *Aqueous solutions, *Sodium chloride, Ions, Cations, Water, Ice, Solutes, Electrical properties, Electricity, Interfaces, Ice-water interfaces, Laboratory tests, Electric charge, Electric potential.

It was established through experimental analysis of freezing of NaCl solution that the positive electric potential arising in the solution above growing ice when the base of the vessel is grounded indicates that the quantity of anions in ice exceeds the quantity of cations. Electric equilibrium was attained in this case through compensation of excess chloride ions, as compared to the concentration of sodium ions, by hydrogen ions. The maximum electric potential was observed in the initial phases of directed freezing. (See also W79-03596)(Sims-ISWS)
W79-03611

BEHAVIOR OF ICE IN RAPIDLY VARYING HIGH INTENSITY ELECTROMAGNETIC FIELDS,
L. B. Nekrasov.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 88-91, August 1976. 8 ref.

Descriptors: *Ice, *Thim films, *Water, *Electromagnetic waves, Physical properties, Films, Nuclear magnetic resonance, Adsorption, Crystals, Properties, Laboratory tests, Ice properties, Ice behavior, Intense electromagnetic fields.

This work attempted to confirm existence of film water in monolithic poly-crystalline ice on the basis of its behavior in a rapidly varying high intensity electoromagnetic field. Results were presented of experiments with samples of highly and weakly mineralized ice, as well as experiments with ice samples prepared from chemically pure water. It was established that in all cases the ice samples underwent intense breakup in response to a high frequency electric field (field frequency 40.68 MHz). The observed pattern of the breakup of ice practically devoid of impurities was explained. (See also W79-03596) (Sims-ISWS)
W79-03612

MAGNETIC SURVEY OF ICE WEDGES,
B. V. Volod'ko, V. S. Yakupov, E. N. Akhmedeyanov, V. M. Kalinin, and V. O. Papitashvili.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 92-96, August 1976. 1 fig.

Descriptors: *Permafrost, *Ice, *Surveys, *Magnetic studies, Mapping, Locating, Boreholes, Soils, Rocks, Frozen ground, Geology, On-site investigations, Remote sensing, *Ice wedges, Subterranean ice.

The results of a magnetic survey with a spacing of 2 x 2 sq m, performed on a plot on Tyungyulinskaya Terrace, were presented. It was demonstrated that there is no correlation between the pattern anomalies and the distribution of magnetic susceptibility of soil in area. Negative anomalies extend-

ing submeridionally and latitudinally, forming a system of polygons, were revealed clearly in plan-view isolines. Drilling data (29 boreholes) clearly confirmed correspondence of negative magnetic anomalies to ice wedges. (See also W79-03596) (Sims-ISWS)
W79-03613

LOW FREQUENCY POLARIZATION OF ICE IN FROZEN COARSE-DISPERSION FORMATIONS,
V. P. Mel'nikov, and A. M. Snegirev.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 97-101. August 1976. 1 fig, 7 ref.

Descriptors: *Permafrost, *Ice, *Remote sensing, Frozen ground, Electrodes, Electrical resistance, Temperature, Thawing, Rocks, Soils, On-site investigations, Laboratory tests, *Ice wedges, Polarizability, Polarization.

The results of experimental laboratory and field studies on low frequency polarization of ion-conducting rock were discussed. It was demonstrated that polarizability can attain values greater than 20%. Even at a temperature of -14C, such polarization attests to the presence of a phase boundary between ice and nonfreezing water. (See also W79-03596) (Sims-ISWS)

ANALYSIS OF GLACIER DYNAMICS USING A LASER DEFORMOGRAPH,
I. M. Belousova, I. P. Ivanov, and N. G. Firsov.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 140-143, August 1976. 1 fig, 4 ref.

Descriptors: *Glaciers, *Movement, *Remote sensing, *Instrumentation, *Antarctic, Deformation, Equipment, Measurement, On-site investigations, Laboratory tests, Light, Ice, Ice cover, Glaciology, *Lasers, Laser deformographs.

The characteristics of a laser deformograph intended for remote determination of the rate of movement and deformation of glaciers were discussed. The design of the instrument and the optical system, which include a helium-neon laser, a receiving-transmitting telescope, and a high precision triple prism reflector, permitted measurement of deformations of 0.1-1 micron/sec at a range of up to 2 km. Experimental data were presented from measured instantaneous rates of movements of glaciers on Antarctica. (See also W79-03596)(Sims-ISWS)

ANALYSIS OF THE ICE LAYER BREAKDOWN PROCESS,
N. A. Grubnik, V. I. Fomin, and A. B. Shemyakin.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 153-154, August 1976. 1 fig.

Descriptors: *Ice, *Mechanical properties, *Laboratory tests, Physical properties, Tensile strength, Elasticity(Mechanical), Flexibility, Vibrations, Strength, Stress, Strength of materials, Ice breakdown, Metallic surfaces, Modulus of elasticity, Breakdown processes.

The modulus of elasticity of ice on a metallic surface was determined by the resonant method of flexural oscillations. Breakup of ice in response to longitudinal oscillations of a metallic rod with ice frozen onto it and in response to flexural oscillations of a plate bearing ice was described. A dependence was revealed between the amplitude of plate sag at which ice begins to break up and various factors. (See also W79-03596)(Sims-ISWS)

ANALYSIS OF THE MECHANICAL PROPERTIES OF FRESHWATER ICE IN THE PRESENCE OF SLOW LOAD CHANGES,
K. N. Korzhavin, and A. B. Ivchenko.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 191-195, August 1976. 1 fig, 10 ref.

Descriptors: *Ice, *Lake ice, *Mechanical properties, *Model studies, Mathematical models, Theoretical analysis, Loads(Forces), Ice loads, Stress, Deformation, Strength, Temperature, Analytical techniques, Rheology, Freshwater ice.

A rheological model describing behavior of ice under a load was selected on the basis of experimental data on the correlation between ice deformation and stress in combination with information on the structure of polycrystalline ice. A rheological equation describing changes in shape in the presence of nonlinear correlation between deformation and stresses for most elements composing the model was obtained for the proposed model. The problem of the stressed state of ice cover in response to temperature change was solved theoretically. The rheological model can be used to solve various problems. The possibility for improving the model as data on structure of ice and its behavior under a load are accumulated is important. (See also W79-03596)(Sims-ISWS)

SHORT-TERM ICE CREEP AND MICRO CRACK FORMATION KINETICS,
Yu. K. Zaretskiy, A. M. Fish, V. P. Gavrilo, and A. V. Gusev.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 196-203, August 1976. 4 fig, 4 ref.

Descriptors: *Ice, *Mechanical properties, *Creep, *Cracks, Stress, Loads(Forces), Ice loads, Deformation, Compressive strength, Acoustic, Elasticity(Mechanical), Model studies, Laboratory tests, Mathematical models, Kinetics, Rheology, Ice breakup

The results of research on short-term creep of freshwater ice samples subjected to single-axis compression were presented. Acoustic emission accompanying deformation of ice under stre

were recorded in experiments. This permitted the authors to reveal the micromechanism behind short-term creep, to provide a physical interpretation of the limit of long-term strength, and to establish the criteria of ice breakup. The fundamental possibility of determining rheological properties of ice from acoustic emission data was demonstrated. (See also W79-03596)(Sims-ISWS)

FIELD ANALYSES OF PHYSIOCOMECHANICAL PROPERTIES OF ICE COVER,
A. Ya. Ryvlin.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 204-209, August 1976. 2 fig, 2 tab.

Descriptors: *Ice cover, *Mechanical properties, *Strength, Ice, Ice loads, Loads(Forces), Lake ice, Temperature, Salinity, Friction, Fluid friction, Roughness(Hydraulic), Physical properties, Yield strength, Data processing, Freshwater ice, Ice breakup.

This article generalized the results of experimental research on the limit of ice cover flexural strength and external ice friction, performed for a number of years on arctic seas and other freezing water basins in the country. Generalized data were presented on the magnitude of constants characterizing these physiocomechanical properties of ice. Empirical computation formulas that can be used in practice to determine the limit of ice cover flexural strength were presented. (See also W79-03596)(Sims-ISWS)
W79-03631

DETERMINATION OF SPECIFIC BREAKUP ENERGY AND CONTACT PRESSURES PRODUCED BY THE IMPACT OF A SOLID AGAINST ICE,
D. Ye. Kheysin, V. A. Likhomanov, and V. A. Kurdyumov
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 210-219, August 1976. 3 fig, 6 ref.

Descriptors: *Ice, *Strength, *Mechanical properties, *On-site investigations, Energy, Data processing, Mathematical models, Equations, Loads(Forces), Ice loads, Velocity, Pressure, Elasticity)Mechanical), Physical properties, Strength of materials, Contact pressures, Impact(Mechanical), Ice breakup, Breakup energy.

Penetration of a solid into an ice surface upon impact was examined. A mathematical model of the penetration process was built on the basis of data from special experiments. This model was used to determine contact pressures in the zone of impact. Maximum contact pressures averaged over the area of the zone of contact turned out to be directly proportional to the unit fractionation energy of ice, which was known from experiments. EARLY DEGLACIATION OF THE LABRADOR SHELF,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Atlantic Geoscience Center.
G. Vilks, and P. J. Mudie.
Science, Vol 202, No 4373, p 1181-1183, December 15, 1978. 2 fig, 1 tab, 24 ref.

Descriptors: *Paleoclimatology, *Glaciers, *Continental shelf, *Atlantic Ocean, Coasts, Sediments, Bottom sediments, Cores, Core logging, Pollen, Core drilling, Subarctic, Cold regions, Glaciology, *Labrador shelf, Deglaciation.

Two marine sediment cores from a basin on the southeastern Labrador Shelf penetrated a mud sequence extending back to 21,000 carbon-14 years before the present (B.P.). The benthic foraminifera were dominated by subarctic nearshore species indicative of ice-free summer waters. The pollen record indicated the presence of a sedge-shrub tundra in eastern Labrador as early as 21,000 years B.P. Both sources of evidence suggested less extensive continental ice than has been reported previously for this subarctic region. (Sims-ISWS)

ACTUAL EVAPOTRANSPIRATION OVER A SUMMER PERIOD IN THE 'HUPSEL CATCHMENT',
Agricultural Univ., Wageningen (Netherlands). Dept. of Hydraulics and Catchment Hydrology.
H. Stricker, and W. Brutsaert.
Journal of Hydrology, Vol. 39, No. 1/2, p 139-157, October 1978. 7 fig, 6 tab, 13 ref.

Descriptors: *Evapotranspiration, *On-site investigations, *Model studies, Mathematical models, Temperature, Air temperature, Winds, Radiation, Humidity, Rainfall, Evaporation, Energy budget, Measurement, Vegetation, Land use, Agriculture, Watersheds(Basins), Heat transfer, *Netherlands.

Actual evapotranspiration was determined in a rural catchment, 'Hupselse Beek', situated in a sandy region in the eastern part of the province of Gelderland, in The Netherlands; the experiment covered a period of nearly 80 days in the summer of 1976, during which a severe drought was experienced in western Europe. Actual evapotranspiration was obtained indirectly by the energy budget on an hourly basis, in which the sensible heat flux was calculated from the mean temperature profile and the wind speed. The sensitivity of the results was analyzed for the choice of the roughness and the zero-plane displacement height in the wind profile, and for errors in the measured temperatures. The calculated results were quite insensitive to the exact formulation of the Monin-Obukhov functions for the mean wind and temperature profiles. However, it was found that the effect of non-neutral atmospheric conditions cannot be neglected; the effect of the buoyancy due to water-vapor stratification on the overall stability of the atmosphere was also noticeable. A comparison with a measure of potential evapotranspiration showed that the actual evapotranspiration was far from the potential. (Sims-ISWS)

EVAPORATION OF WATER FROM SAND, 6. THE INFLUENCE OF THE WATER TABLE ON DIURNAL VARIATIONS,
National Inst. for Water Research, Windhoek (South West Africa).
D. H. R. Hellwig.
Journal of Hydrology, Vol 39, No 1/2, p 129-138, October 1978. 6 fig, 3 tab, 2 ref.

Descriptors: *Evaporation, *Sands, *Water table, Diurnal distribution, Arid climates, Arid lands, Radiation, Condensation, Lysimeters, Temperature, Variability, Vapor pressure, *Sand tanks, *Diurnal evaluation, Diurnal variation, Diurnal peak, Condensation surface, Evaporation tanks, Vapor pressure deficit.

Evaporation from sand tanks in an arid climate was estimated by measuring the amount of water needed to maintain the water table at a prescribed, fixed level. In earlier experiments, two peaks were found, one in the afternoon and the other at sunrise. To obtain more reliable information on the phenomenon of the peak at sunrise, hourly data were evaluated from an evaporation experiment which lasted 847 days. The results of 518 days were used for a diurnal evaluation. It was confirmed that two peaks occurred during a 24-hour period. One peak was related to radiation, and the deeper the water table was kept below the sand surface, the later the peak occurred. This was the absolute diurnal peak for those tanks in which the sand surface was never dry. It was a relative diurnal peak for those tanks in which the sand surface was normally dry. The other peak appeared at sunrise and was related to the air temperature. This peak was independent of the depth of the water table up to a depth of 400 mm below the sand surface. Down to a water table of 600 mm below the sand surface, the time lag at which this peak occurred relative to the lowest air temperature increased for up to 2 hours. This peak was a relative diurnal peak for those tanks in which the sand surface was never dry. It was the absolute diurnal peak for those tanks in which the sand surface was normally dry. It appeared as if the evaporation peak at sunrise depended on the presence of a condensation surface. (See also W74-11267, W74-11266, W74-07169, W73-07056 and W73-07055) (Roberts-ISWS)

SIMULATION PROCEDURES FOR BOX-JENKINS MODELS,
University of Western Ontario, London.
A. I. McLeod, and K. W. Hipel.
Water Resources Research, Vol 14, No 5, p 969-975, October 1978. 2 tab, 35 ref.

Descriptors: *Simulation analysis, *Synthetic hydrology, *Reservoir design, *Model studies, *Algorithms, *Parametric uncertainty, *Box-Jenkins model, Stochastic processes, Computer models, Computer programs, Equations, Hydrologic data, Systems analysis.

New simulation procedures are presented for generating synthetic data from either a nonseasonal or a seasonal Box-Jenkins model. The simulation techniques are designed so that random realizations of the underlying stochastic process are employed for starting values. Becaused fixed beginning values are not utilized, systematic bias is not introduced into the synthetic trace. When the data have been transformed by a Box-Cox transformation, the inverse transformation can be conveniently incorporated into the simulation process. Also, a new algorithm is presented for simulating integrated models. A method is developed for incorporating parameter uncertainty into simulation studies, and it is explained how this technique can be used in the design of reservoirs. Practical applications are presented to demonstrate the efficacy of the aforesaid simulation methods. In addition, the Fortran computer subroutines for the simulation procedures are included in an appendix with the microfiche edition of this paper. (Bell-Cornell)

METEOROLOGICAL ANALYSIS OF AN OAHU FLOOD,
Hawaii Univ., Honolulu. Dept. of Meteorology.
T. A. Schroeder.
Monthly Weather Review, Vol. 105, No. 4, p 458-

468, April 1977. 14 fig, 2 tab, 10 ref. OWRT A-062-HI(2).

Descriptors: *Flood data, *Oahu, *Thunderstorms, *Synoptic analysis, Weather data, Rain, Weather patterns, Rainfall intensity, Rainfall-runoff relationships, Instrumentation, Rain gages, Networks, Stream gages, Hawaii.

Results of a detailed study of the severe rainstorm on the island of Oahu, Hawaii, on April 19, 1974 are reported. Weather conditions leading to flood conditions in Hawaii have been classified as: (1) upper tropospheric troughs which overlie surface trade winds in any season; (2) cold fronts penetrating Hawaii from midlatitudes; (3) Kona lows developing west of the islands during the winter; and (4) tropical cyclones. The storm under study resulted from the first condition. Examinations of the extensive rain gage system on Oahu were made to determine the mesoscale structures of the precipitating cloud systems. From a study of special rain and stream gage network in Moanalua Valley it was concluded that the existing Hawaiian flood detection system is inadequate. Information obtained from the rain gages was incorporated with available meteorological observations, and a conceptual model of the flood producing system for this storm was constructed. It was concluded that the mountainous terrain of the area is a major element in the persistance of thunderstorm activity (Davison-IPA)

Descriptors: *Groundwater, *Groundwater recharge, Groundwater movement, *Surface-Groundwater relationships, Synthetic hydrology, Stochastic processes, Tritium, Aquifers, Springs, Wells, Streams, *Roswell Basin(N MEX), *New Mexico, *Yeso aquifer(NMEX), *Glorieta aquifer(NMEX).

An examination of recharge and groundwater conditions of the western region of the Roswell basin is presented. Recharge mechanisms are proposed on the basis of several long record observation wells. Water levels with long trends are associated with recharge from areal precipitation. It is throught that several years of above average rainfall are necessary to increase groundwater storage significantly. A fluctuating cyclic response is associated with channel leakage from streams in the study area. This recharge mechanism was verified using a stochastic stream-aquifer model applied to the Rio Hondo and Rio Penasco drainages. With this model, channel leakage and aquifer parameters could be estimated. The two types of water level response are associated with characteristic tritium levels. High tritium levels in wells near streams verify a fast recharge component indicated by the model. For wells not located near streams in the intake area and for wells in the Principal Aquifer, low tritium values are found. These wells indicate longer residence times than perviously suggested. It seems likely that precipitation on the region outside the Principal Intake Area supplies a significant portion of total recharge to the Principal Aquifer. (Stockton-N Mex)

ESTIMATING GROUNDWATER RECHARGE FROM CONSERVATION BENCH TERRACES,
Kansas State Univ., Manhattan. Dept. of Agricultural Engineering.
W. H. Neibling.
Master's Thesis, 1976. 133 p, 19 fig, 19 tab. OWRT A-068-Kan(1).

Descriptors: Hydrologic aspects, *Groundwater recharge, *Evapotranspiration, Meteorological data, Weather data, Computer models, Crop rotations, Soil properties, Soil moisture, Drainage effects, Soil types, Loam, Silts, Watersheds(Basins), Terraces(Agricultural), Water conservation, Natural recharge.

In determining the potential for groundwater recharge from conservation beach terraces a continuous water-budget type computer model was developed. Inputs or crop and soil moisture properties, and daily weather observations were used to calculate daily potential evapotranspiration, actual evapotranspiration and soil moisture changes in a 213 cm soil profile. Laboratory tests were conducted to determine the relationships of soil water potential-soil water content, ad unsaturated hydraulic conductivity-soil water content for the silt loam soil in the conservation bench terrace area study The water budget model utiliZed these relationships in calculating daily soil water movement across the 183 cm depth boundary. Weather records from 1945 through 1974 were used to make computer runs containing four model combinations or crop rotations and watershed: bench ratios utilized on the conservation bench terraces. Wheat-fallow rotation runs were made for the watershed areas. ad either wheat-fallow or continuous grain sorghum rotation runs were made on the benches. All bench areas showed a larger recharge rate than was calculated for the sloping watershed conditions. It is concluded that conservation bench terraces have the potential for ground water recharge when used on the type of soil studied; the effectiveness of the recharge structure is dependent on the choice of crop rotations and watershed: bench area ratio. APPARENT TRANSMISSIVITY AND ITS DETERMINATION BY NOMOGRAM,
Alberta Research Council, Edmonton. Groundwater Div
G. F. Ozoray
In: Contributions to the Hydrogeology of Alberta, Bulletin 35, Alberta Research Council, Edmonton, p 13-17, 1977. 2 fig, 6 ref.

Descriptors: *Groundwater, *Transmissivity, *Equations, Pumping, Drawdown, Geology, Hydrogeology, Hydraulic conductivity, Aquifers, Aquifer characteristics, Permeability, Hydrology, *Nomograms.

Apparent transmissivity values can provide a valuable indication of regional variations in relevant rock properties. Apparent transmissivity was calculated from the duration and rate of pumping (bailing) and from the resulting total drawdown Graphically, a straight line was substituted for the real drawdown curve, and the starting point of the time scale was arbitrarily selected as 0.1 minute (because 0 cannot be represented on the semilog paper) By definition, apparent transmissivity was then calculated with Jacob's modified non-equilibrium formula as follows: T(app) = 264 Q log (10 t)/s where: T(app) = apparent transmissivity in imperial gallons day foot (igpd ft), Q = pumping or bailing in imperial gallons minute (igpm), s = total drawdown in feet, and t = total duration of pumping or bailing in minutes. A nomogram was presented which facilitates quick graphic determination of apparent transmissivity. The construction of the nomogram was explained, and practical

examples were given for its use. (See also W79-03819)(Sims-ISWS)

Formal similarity between the laws governing flow of fluids in permeable media and electric currents allows subsurface fluid potential distributions to be modelled by electric analogy using a conductive medium such as Teledeltos paper. Such models can presently incorporate, to a certain extent, hydraulic conductivity variations both in direction and magnitude and play a useful role in the process of groundwater flow evaluation. SOME EFFECTS OF SOIL SURFACE COVER ON INFILTRATION,
Auburn Univ., AL.
J. L. Koon.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 560, Price codes: A06 in paper copy, A01 in microfiche. Ph.D. Dissertation, August 1968, 86 p, 20 fig, 23 tab, 25 ref. OWRT A-005-ALA(2).

Descriptors: *Soil surface cover, *Infiltration rate, *Raindrop impact, *Regression analysis, *Simulated rainfall, Soil types, Infiltration, *Multiple regression techniques.

To evaluate the effects of soil surface cover on the infiltration rate of soils exposed to raindrop impact, simulated rainfall was applied at a constant rate to one soil type in small plots with free drainage, and aquare- and rectangular-cover particles of varying sizes and percentages were used as surface cover. The data were analyzed by multiple regression techniques and an expression relating the infiltration per unit length of cover perimeter to a characteristic geometrical distance was developed. The variables included in this analysis were: (1) the number of cover particles (N), (2) the perimeter of the individual cover particles (P), (3) the distance from the center of the cover particles to the center of space between cover particles (D), (4) the width of the cover particle (L), (5) the ratio of area covered (AC) to the total area (AT). The equation: $100\ I/NP = 0.12 + 2.28\ (2D - L)\ (AC/AT)$, was shown to represent the data with a high coefficient of determination.

Descriptors: *Infilration, *Infiltration rates, *Variable rainfall, *Equations, *Ponding, Rainfall intensity, Soil moisture.

Formulae were derived for prediction of ponding time and cumulative infiltration following ponding under a condition of variable and even intermittent rainfall. The derivations do not assume immediate saturation at the surface nor a piston displacement of air by water; they include the viscous flow of air. The results were compared with experimental data for two conditions: constant rainfall and intermittent rainfall. The proposed formulae are simple to use, requiring no complex solution of a partial or even an ordinary differential equation. The numerical calculations presented in the report were performed with a small pocket calculator. The agreement with experimental data is good

MICROBIAL POPULATIONS IN FLOODED SWAMP SOILS OF SOUTH CAROLINA,
Southeastern Forest Experiment Station, Asheville, NC.
D. S. Priester, and W. R. Harms.
Research Note SE-238, Southeastern Forest Experiment Station, Asheville, North Carolina, April, 1977. 8 p, 2 fig, 4 tab, 8 ref.

Descriptors: *Swamps, *South Carolina, *Soil microorganisms, Wetlands, Aquatic microorganisms, Soil bacteria, Actinomycetes, Clostridium, Soil microbiology, Soil fungi.

The effects were investigated of three kinds of flooding, soil type, and time of year on the growth of microorganisms in swamp soil of the Wehadkee and Portsmouth series. The soils flooded with moving water had significantly more aerobes and fewer anaerobes than did soils flooded with stagnant water. Soils that were deep-flooded with moving water had greater numbers of microbes than did the soils with stagnant water and those surface-flooded with moving water. The Wehadkee soil and significantly greater populations than did the portsmouth soil, regardless of water regime. Populations were greater in the summer than in the spring and fall. The most prevalent genus of aerobic and facultatively anaerobic bacteria was Bucillus Cohn, 1872. The actinomycetes isolated were Nocardia trevisan, 1889 and Streptomyces Waksman and Henrici, 1943. The only strict anaerobe was Clostridium Prazmowski, 1880. Of the fungi, the most prevalent genera were Penicillium Link and Cladosporium Link. (Steiner-Mass)

investigations, Moisture content, On-site tests, Laboratory tests, Percolation, *Tritiated water tracer, Water movement in macropores, Soil-water displacement.

Displacement of initial soil water by simulated rainfall was measured in aggregates of Maury silt loam soil in columns in the laboratory and under field conditions using tritiated water and/or Cl(-) as a tracer of added water. Displacement values measured in aggregates were larger (53 to 85%) than those measured under field conditions (7 to 56%). Percent displacement of initial soil water in Calloway silt loam under field conditions was similar to that of Maury, but was larger in Huntington silty clay loam than in Maury. Initial soil water content of Maury soil did not appear to affect percent displacement. Percent displacement in Maury soil increased as the depth of tillage increased. (Lee-ISWS)

A MATHEMATICAL TREATMENT OF INFILTRATION FROM A LINE SOURCE INTO AN INCLINED POROUS MEDIUM,
Colorado State Unive., Fort Collins. Dept. of Mathematics.
D. W. Zachmann.
Soil Science Society of America Journal, Vol 42, No 5, p 685-688, September-October 1978. 3 fig, 1 tab, 15 ref.

Descriptors: *Infiltration, *Hydraulic conductivity, *Porous media, *Model studies, Mathematical models, Soil water, Soil water movement, Soils, Clays, Sands, Steady flow, Equations, Soil science, Line sources.

An exact mathematical solution was obtained for two-dimensional, steady infiltration from a line source into an inclined porous medium with an impermeable lower boundary. Unsaturated hydraulic conductivity was assumed to be an exponential function of pressure head. Equations for a stream function and the pressure head were developed, and stream lines and contours of constant pressure head were plotted for a sandy soil and a clay soil using inclinations of 5 deg and 20 deg from horizontal. THE EFFECT OF STABILIZED, HYDROPHOBIC AGGREGATE LAYER PROPERTIES ON SOIL WATER REGIME AND SEEDLING EMERGENCE,
Hebrew Univ., Rehovoth (Israel). Faculty of Agriculture.
E. Rawitz, and A. Hazan.
Soil Science Society of American Journal, Vol. 42, No. 5, p 787-793, September-October 1978. 9 fig, 2 tab, 24 ref.

Descriptors: *Mulching, *Water conservation, *Soil moisture, Soil properties, Soil texture, Irrigation, Seeds, Seedbed treatment, Erosion, Laboratory tests, Evaporation, Wetting, Drying, Aggregates, Soil aggregates, Soil science, *Seedling emergence, Soil crusts.

Soil crusts affect both the profile water regime and the fate of crop seedlings. The former is affected via modification of infiltration, evaporation, and redistribution, while mechanical crust impedance prevents or retards seedling emergence. Growers alleviate this problem by frequent, small irrigations, which are costly in water, equipment, and labor. This study was conducted to determine whether surface soil properties could be modified by layers of stabilized, hydrophobic aggregates so as to render these irrigations unnecessary. Unstable aggregates of a clay-loam soil were treated with 7% potassium siliconate and 1% polyvinyl acetate based on dry-weight of soil and sprayed in water to wet the soil to 15% gravimetric water content. Layers of soil mixes with different aggregate-size distribution were placed in transparent columns and given a simulated rainfall; then the progress of infiltration, redistribution, and drying was followed. The most promising mix was used in large outdoor tanks as a mulch for carrots, using 1- and 4-cm mulch layers with 0, 25, 50, and 100% cover of the soil surface. The soil was given one post-sowing sprinkler irrigation, and the soil moisture regime was monitored by microtensiometers and a two-probe gamma gauge. A 100% cover of 4-cm deep mulch of treated aggregates was the most effective for water conservation. It decreased water loss by 20% over a 14-day period. Seedling emergence was clost to 90% under a 1-cm mulch and 50% under a 4-cm layer, both of which were superior to the unmulched control treatment. (Sims-ISWS)

Soil water diffusivity values of a sandy loam soil, measured by Bruce and Klute's and Gardner's methods, were compared with those calculated from the moisture-suction relationship. The measured values of diffusivity were correlated significantly with calculated values of diffusivity. Bruce and Klute's method overestimated diffusivity values at different moisture contents compared with those calculated from the moisture-suction reltionship. Diffusivity values measured by Gardner's method and those calculated were almost identical. (Adams-ISWS)

California Univ., Riverside. Dept. of Soil and Environmental Sciences.
W. A. Jury, and L. V. Weeks.
Soil Science Society of America Journal, Vol. 42, No. 5, p 679-684, September-October 1978. 7 fig, 3 tab, 10 ref.

Descriptors: *Leaching, *Salts, *Ion exchange, *Model studies, Mathematical models, Groundwater movement, Solutes, Saline water, Brines, Tile drains, Tile drainage, Soils, Soil water, Thermal water, Travel time.

The time required to leach a slug of saline, sodic geothermal brine from the point of injection to the tile outlet of an artificially drained field was calculated. Sprinkler, complete, and partial ponding leaching methods were compared as a function of drain spacing and initial location of the spill. Calculated results were presented as dimensionless parameters which scale the drainage system dimensions and the soil water transport properties. Ponded leaching required more water, but less time to leach brine out of the system for all situations except where the brine spill occurs near the midpoint between tile lines. A simple calculation was proposed to estimate the leaching fluid volume required to remove excess Na(+) from the exchange complex. Good agreement was attained between simulated and experimental results involving a laboratory soil column. For fine-textured soils in the Imperial Valley of California, it may require up to 30 pore vlumes of leaching fluid to replace Na(+) with Ca(2+) if saturated gypsum solution is used in reclamation. Application time per pore volume was calculated to be in excess of 1 year for all cases except ponded leaching directly over a tile line. (See also W76-05905 and W76-05904) (Sims-ISWS)

COUPLING PHENOMENA IN SATURATED HOMO-IONIC MONTMORILLONITE: III. ANALYSIS,
Guelp Univ. (Ontario). Dept. of Land Resource Science
P H Groenevelt, D E Elrick, and T J M Blom
Soil Science Society of America Journal, Vol. 42, No. 5, p. 671-674, September-October 1978. 1 fig, 2 tab, 3 ref.

Descriptors: *Montmorillonite, *Ion transport, *Equations, *Mathematical models, Evaluation, Data processing, Electrodes, Sodium, Chlorides, Clays, Zeta potential, Electrochemistry, Cations, Clay-water-salt systems, Data analysis, Transport equations.

The data presented in the first paper of this series were analyzed using the theoretical transport equations and the analytical expressions for the transport equations and the analytical expression for the transport coefficients developed in the second paper of the series. When the electrodes of the system presented in Part I of this series are not shorted, the predicted behavior corresponds precisely with the actual behavior. Upon shorting the electrodes, the data indicated that the actual shorting of the clay-water system is not perfect, an indication that the electrodes cannot release and absorb Cl-ions infinitely fast. From the data, the shorting efficiency was calculated. The flux of cations through the clay-water system while the electrodes are shorted then can be calculated. The absolute value of this flux appears to be slightly larger than the value calculated from the decrease

in time of the salt concentration difference in the two liquid compartments. This is likely due to the buildup of a salt concentration gradient in the membranes. (See also W77-01138, W77-05420) (Visocky-ISWS)

Water Resources Bulletin, Vol. 11, No. 3, p 449-454, June 1975. 2 fig, 1 tab, 5 ref. OWRT A-026-ARK(1).

Descriptors: *Mathematical models, *Lakes, *Thermal properties, *Thermocline, Isotherms, Water properties, Reservoirs, Energy equation, Equations, *Arkansas.

A proposed thermal model to accompany a primary production model for the eutrophication processes in lakes is presented. A lake, visualized as a solid body occupying the space from X=D to X= infinity, is heated mainly through the air-water interface. Mathematical equations give the surface temperature, the temperature profile, including depth, and the position of the thermocline as a function of time. Preliminary tests of the interpretative and predictive aspects of the proposed model were carried out using temperature field data on Beaver Reservoir in Northwest Arkansas. In deep fresh water bodies, the general shape of the temperature profile is structured by the net heat input at the air-water interface and the time lapse since an isotherm state existed. AN ANALYSIS OF LAKE LEVEL INFLUENCE ON VEGETATION IN LAKE CHAMPLAIN,
Aquatec, Inc., South Burlington, VT.
W. D. Countryman.
Fish and Wildlife Service, Newton Corner, Massachusetts, August, 1977. 2 fig, 117 ref, 4 append.

Descriptors: *Wetlands, *Lake Champlain, *Water levels, *Vegetation effects, Marshes, Freshwater marshes, Marsh management, Reservoir management, Lakes.

If water levels were controlled so as not to exceed 30.5 meters, only minor changes in existing wetland plant communities would occur. The major plant association to be affected by such a regulation scheme would be the grass and sedge meadow community. Historically, the areas occupied by this plant association are only inundated for short periods of time in the spring and only in years of high water. If water levels were controlled so as not to exceed 30.0 meters, a slight loss of swamp forest community would occur in addition to the loss of the grass and sedge meadow. Regulation so as not to exceed 29.5 meters would result in the loss of much of the swamp forest and slight changes in the emergent plant community. If water levels were regulated so as not to exceed 29.0 meters, major changes to all marsh land vegetation communities would occur. (Steiner-Mass)

PRIMARY PRODUCTION IN THE FRESHWATER MARSH ECOSYSTEM OF TROY MEADOWS, NEW JERSEY,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Botany.
R. A. Jervis.
Bulletin of the Torrey Botanical Club, Vol. 96, No. 2, p 209-231, 1969. 7 fig, 5 tab, 59 ref.

Descriptors: *Freshwater marshes, *New Jersey, *Primary productivity, Wetlands, Marshes, Marsh plants, Productivity, Cattails, Rooted aquatic plants, Efficiencies.

Primary production was studied in four freshwater marsh communities: an open aquatic system of emergent and floating plsants, a cattail community, a swale of sedge tussocks and associated herbaceous tussock colonists, and a sedge-shrub thicket. Although the four communities differed considerably in vegetative structure, they did not differ significantly in production rates or production efficiencies (production per unit of leaf surface). The seasonal course of production varied among species and among communities. In general, early summer was the most productive period. It followed a springtime development of photosynthetic capital, which was most rapid in the predominantly rhizomatous cattail community when there was a marked recall of stored foods. Production thereafter decreased except for a slight fall upswing. The estimated average (9.50 g/sq m/day) and maximum (20.94 g/sq m/day during the early summer) productivities are among the highest reported for natural vegetation. Soil colloids and the ground water nutrient level were high, and it is suggested that these variables, along with the abundance of soil moisture and an unusually well-adapted flora, are the major factors contributing to the high marsh productivity. (Steiner-Mass)

THEORETICAL MODEL OF THE LITTORAL DRIFT SYSTEM IN THE TORONTO WATERFRONT AREA, LAKE ONTARIO,
Scarborough Coll., Toronto (Ontario).
B. Greenwood, and D. G. McGillivray.
Journal of Great Lakes Research, Vol. 4, No. 1, p 84-102, March 1978. 14 fig, 3 tab, 72 ref.

Descriptors: *Littoral drift, *Lake Ontario, *Model studies, Mathematical models, Waves(Water), Lakes, Shores, Beaches, Geomorphology, Erosion, Deposition(Sediments), Sediment transport, Winds, Climatology, Theoretical analysis.

A computer model was described which simulated the interaction between shoreline geometry and shoaling waves in the Toronto waterfront area on the north shore of Lake Ontario, between Highland Creek in the east and the Credit River in the west, and established potential littoral drift patterns. Thirteen wave conditions, defined by height, period and direction of approach, characterizing the annual hindcast spectrum for Toronto, were used in the determination of the shore-parallel components of wave energy flux. To identify the long-term net effects of the distribution of wave energy flux which produce the dominant littoral drift pattern, a simple summation procedure was used whereby the individual effect of any wave condition at a shoreline point is weighted according to its frequency of occurrence. The long-term average pattern of potential littoral drift, based on zones of potential erosion (increasing alongshore wave energy flux), transport (constant alongshore wave energy flux), and deposition (decreasing alongshore wave energy flux), was established. Identification of nodal points (zero alongshore wave energy flux) and drift cells allows a test of the 'geomorphological sense' of the model by comparison with observed drift patterns. (Sims-ISWS)
